### **DECLARATION OF CONFORMITY**

#### The directives covered by this declaration

Low voltage Equipment Directive, amended by 93/68/EEC 73123/EEC

89/336/EEC Electromagnetic Compatibility Directive, amended by 92/31/EEC &

93/68/EEC

#### Product(s)

### 1260A Impedance Analyzer

#### Basis on which conformity is being declared

The product(s) identified above comply with the requirements of the EU directives by meeting the following standards:

BS EN50081-1:1992 Electromagnetic Compatibility - Generic Emission Standard

Part 1: Residential, commercial and light industry.

BS EN50082-1:1992 Electromagnetic Compatibility - Generic Immunity Standard

Part 1: Residential, commercial and light industry.

EN61010-1:1993 Safety requirements for electrical equipment for

measurement, control and laboratory use. Accordingly the

CE mark has been applied to this product.

hile lay Signed

**Group Limited** 

**Authority: Engineering Manager** 

December 1995 Date:

#### **GENERAL SAFETY PRECAUTIONS**

The equipment described in this manual has been designed in accordance with EN6 1010 'Safety requirements for electrical equipment for measurement, control and laboratory use', and has been supplied in a safe condition. To avoid injury to an operator or service technician the safety precautions given below, and throughout the manual, must be strictly adhered to, whenever the equipment is operated, serviced or repaired. For specific safety details, please refer to the relevant sections within the manual.

The equipment is designed solely for electronic measurement and should be used for no other purpose. Solartron Instruments accept no responsibility for accidents or damage resulting from any failure to comply with these precautions.

#### **GROUNDING**

To minimize the hazard of electrical shock it is essential that the equipment is connected to a protective ground whenever the power supply, measurement or control circuits are connected, even if the equipment is switched off. The protective ground for ac and dc supplies is connected separately.

AC GROUND is connected via the ac supply cord. The cord must be plugged into an ac line outlet with a protective ground contact. When an extension lead is used, this must also contain a ground conductor. Always connect the ac supply cord to the supply outlet before connecting the control and signal cables; and, conversely, always disconnect control and signal cables before disconnecting the ac supply cord. The ac ground connection must have a continuous current rating of 6A, and be capable of taking 25A for a minimum of one minute.

#### **AC SUPPLY VOLTAGE**

Never operate the equipment from a line voltage or frequency in excess of that specified. Otherwise, the insulation of internal components may break down and cause excessive leakage currents.

#### **FUSES**

Before switching on the equipment check that the fuses accessible from the exterior of the equipment are of the correct rating. The rating of the ac line fuse must be in accordance with the voltage of the ac supply.

Should any fuse continually blow, do not insert a fuse of a higher rating. Switch the equipment off, clearly label it "unserviceable" and inform a service technician.

#### **EXPLOSIVE ATMOSPHERES**

NEVER OPERATE the equipment, or any sensors connected to the equipment, in a potentially explosive atmosphere. It is NOT intrinsically safe and could possibly cause an explosion.

Continued overleaf.

#### **SAFETY PRECAUTIONS** (continued from previous page)

#### **SAFETY SYMBOLS**

For the guidance and protection of the user, the following safety symbols appear on the equipment:

SYMBOL MEANING

Refer to operating manual for detailed instructions of use.

Hazardous voltages.

#### **NOTES, CAUTIONS AND WARNINGS**

For the guidance and protection of the user, Notes, Cautions and Warnings appear throughout the manual. The significance of these is as follows:

NOTES highlight important information for the reader's special attention.

CAUTIONS guide the reader in avoiding damage to the equipment.

WARNINGS guide the reader in avoiding a hazard that could cause injury or death.

#### **AVOID UNSAFE EQUIPMENT**

The equipment may be unsafe if any of the following statements apply:

- · Equipment shows visible damage.
- Equipment has failed to perform an intended operation.
- Equipment has been subjected to prolonged storage under unfavorable conditions.
- Equipment has been subjected to severe physical stress.

If in any doubt as to the serviceability of the equipment, don't use it. Get it properly checked out by a qualified service technician.

#### **LIVE CONDUCTORS**

When the equipment is connected to its measurement inputs or supply, the opening of covers or removal of parts could expose live conductors. The equipment must be disconnected from all power and signal sources before it is opened for any adjustment, replacement, maintenance or repair. Adjustments, maintenance or repair, must be done only by qualified personnel, who should refer to the Maintenance Manual.

**EQUIPMENT MODIFICATION** To avoid introducing safety hazards, never install non-standard parts in the equipment, or make any unauthorized modification. To maintain safety, always return the equipment to Solartron for service and repair.

1.1	Key Features	1.3
1.2	Use of the Manual	1.4
1.3	Specification	1.5

#### 1.1 KEY FEATURES

The 1260 Impedance/Gain-Phase Analyzer uses powerful microprocessor-controlled digital and analog techniques to provide a comprehensive range of impedance and frequency response measuring facilities. These include:

- Single sine drive and analysis of the system or component under test over the frequency range 10μHz to 32MHz.
- ➤ Measurement integration, and auto-integration, of the analyzer input, for harmonic and noise rejection.
- Sweep facility, for any one of three measurement variables, frequency, amplitude, or bias.
- ➤ A comprehensive range of voltage and current transfer characteristics, each one available from the original base data, which includes:
  - · polar, log polar, and Cartesian co-ordinates of the voltage measurement result,
  - polar and cartesian co-ordinates of current transfer characteristics,
  - · polar and cartesian co-ordinates of impedance and admittance,
  - inductance or capacitance values, with resistance, quality factor, or dissipation factor, for series or parallel circuits.
- > Plotter output, of immediate or filed data, to a digital plotter on the GPIB.
- ➤ Limit check and data reduction facility. Data output can be confined to those results that fall within, or outside, user-defined values.
- > Output ports selectable from: RS 423, GPIB, and the History File.
- Result scaling, that includes: a normalization facility that separates the desired results from confusing background data; and, for impedance measurements, a nulling facility that compensates for stray capacitance and inductance.
- Vernier facility, which allows the drive to be adjusted whilst measurements are being made.
- ➤ Learn program facility, which allows the instrument to learn a series of control settings and commands.
- Component sorting, manual or automatic.
- > Self test facility.
- ➤ Local control from a simplified key panel, or remote control from the GPIB.

1-2 12600012\_Gmacd/CB

#### 1.2 USE OF THE MANUAL

- **Chapter 2** Describes how to install the instrument. This procedure should be followed implicitly, to ensure safe and reliable operation of the instrument.
- **Chapter 3** Introduces .the front panel controls and, by means of simple examples, shows you how to start using the instrument.
- **Chapter 4** Summarises the control menus. This information, which also appears on a blue pull-out card at the front of the manual, is intended as a memory aid for experienced users.
- **Chapter 5** Is an encyclopaedia of menu terms and explains the meaning and background of each individual control setting.
- **Chapter 6** Explains how to connect the instrument to the item under test.
- **Chapter 7** Gives detailed information on how to control the instrument remotely, from the GPIB. Guidance in the use of RS 423 is given also.
- **Chapter 8** Remote Commands
- Chapter 9 Lists the error messages. Error messages are displayed (and an error code is output to a remote device) when a bad command has been given to the instrument or an unacceptable control condition exists.
- **Chapter 10** Shows how the measurement results may be scaled and/or limits checked.
- **Chapter 11** Shows how the instrument may be made to store a series of commands, to be executed later as a *learnt program*.

#### 1.3 1260 SPECIFICATION

These specifications will apply under any combination of stated operating conditions, such as temperature, humidity and signal type. They are guaranteed (not typical) and valid for one year after calibration.

As part of the production procedure every instrument is thoroughly soak-tested, then autocalibrated to a tolerance better than that specified. Solartron designs and manufactures to BS EN 9001.

### Generator Frequency,

Outer floating to:

Coupling:

Input protected to: ±250mA

floating, single BNC

100kΩ, <200pF

±0.4V

dc or ac (-3dB at 1Hz)

#### Sweep,

Types: frequency (logarithmic or linear) amplitude (linear)

dc bias (linear)

Resolution: >10000 points frequency >200 points amplitude or bias Control: up, down, step, hold

Maximum current: ±100mA
Maximum voltage, Hi to Lo: ±46V
Lo to ground: 0.4V

Output impedance, voltage:  $50\Omega \pm 1\%$  current, at <1kHz: >200k $\Omega$ 

 $\begin{array}{ccc} & Lo \ to \ ground: & 100 k\Omega < 10nF \\ Connection: & floating, \ single \ BNC \\ Output \ disable: & contact \ closure \ or \ TTL \ logic \ 0 \\ Output \ is \ short-circuit \ proof \end{array}$ 

Integration time:  $10 \text{ms to } 10^5 \text{s or auto}$  Measurement delay:  $0 \text{ to } 10^5$ 

1-4 12600012\_Gmacd/CB

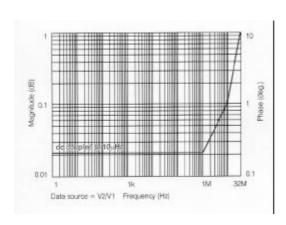

<sup>\*\*</sup>For frequencies >10MHz maximum current 20mA rms

#### **Limits of Error**

Ambient temperature 20  $\pm 10^{\circ} C$ , integration time >200ms. Single ended inputs with  $50\Omega$  termination, outer grounded. Data valid for one year after calibration.

#### **Gain-Phase Measurements**

Applies to all ranges at >10% full scale Specification for V2/V1, or V1/V2.

#### Display

Type: vacuum fluorescent, dot matrix
Functions, variable: frequency, amplitude, dc bias inputs V1, V2, I, V2/V1, V1/V2, V1/I, I/V1, V2/I, I/V2

Parameters: magnitude, phase, gain, in-phase, quadrature impedance/admittance, group delay resistance, capacitance, inductance

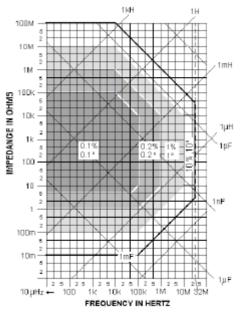

Q-factor, D

 $\begin{array}{ll} \mbox{Resolution, gain r (dB):} & 0.001 \mbox{ dB} \\ \mbox{phase } (\theta): & 0.01 \mbox{deg} \end{array}$ 

others: 5 digit + exponent

#### **Impedance Measurement**

Applies for stimulation level of 1V for impedances >50 $\Omega$  or 20mA for impedances <50 $\Omega$ , using 12601A.

#### Impedance Ranges

Capacitance: 1pF to 10mF resolution 5 digits
Resistance: 10m to 100M resolution 5 digits
Inductance: 100nH to 1000H resolution 5 digits

#### **DATA PROCESSING**

Scaling: normalization by measured spectrum

scaling by measured point scaling by a complex constant

integration, differentiation inclusion of result in a polynomial expansion

deviation from measured point, absolute value or percentage

Math, operators: +, -,\*, /,  $j\omega,$  powers, nested brackets

operands: V1, V2, I, complex constants

 $\sigma$ ,  $\sigma^2$ , count, max., min., mean Statistical analysis:

#### **INTERFACES**

Parallel:

Serial output: complies with RS 232 and RS 423

baud rates: 110, 150, 300, 600 1200, 2400, 4800, 9600

complies with IEEE488 (1978)

fully programmable talker/listener

switch selectable talk only for plotting/printing

Maximum data rate: 1000bytes/s

Functions implemented: SH1, AH1, T5, TE0, L4 LE0, SR1, RL1, PP2, DC1, C0, DT0

complies with IEEE754 for Data format: 4 byte wide transfers

#### **PLOTTING**

digital, Type:

complies with Hewlett Packard Graphics Language and Enertec Schlumberger Graphics Language

Interface: IEEE488 in talk only mode Parameters, independent variable:frequency, amplitude, dc bias dependent variables:  $r\theta; r(dB) \; \theta; r\tau; r(dB)\tau;$ 

a jb;Z θ;Y θ;L/C R;R Q/D

X axis item: independent or dependent variable Y axis item: one, or two, related dependent variables

Axis limits: auto or user defined, logarithmic or linear Plot size: A3 or A4, or variable in 0.025mm steps Annotation: full grid or axis markers

parameters description user entered text (up to 25 characters)

#### **DATA STORE**

Type: battery backed random access memory Size, group delay mode: >280 results >400 results other modes:

Stored information: frequency, V1, V2, I

generator amplitude and dc bias error and input range codes

Recall: any display combination, with processing if required

typically > 1 month Storage duration, power off:

#### **PROGRAM STORAGE**

Battery backed random access memory: 9 programs

>300 instructions

9 keyboard set-ups 9 constants

Write protectable permanent memory: 9 programs >100 instructions

6 keyboard set-ups

9 constants

#### **GENERAL**

Line voltage, switch selectable: 90 to 126V, 198 to 252V ac, 48 to 65Hz

Consumption: 230VA

Environment,

temperature, operating: 0 to 50°C storage: -40 to 70°C specification limits: 10 to 30°C

95% at 40°C humidity, non-condensing:

tested in accordance with BS EN 60068 vibration:

complies with IEC 1010-1 (EN61010-1)

Electromagnetic Compatibility

complies with EN50081-1 and EN50082-1

Dimensions, height: 176mm (6.93ins) 432mm (17ins) width: 573mm (22.56ins) depth: 4U, 19ins rack size:

Weight: 18kg (40lbs)

**CAUTION** SAFETY BONDING TESTS (EN61010, clause 6.5.1.2)

The analyzer input connectors and the generator output connector have driven screens (low terminal), **which should not be subjected to a safety bonding test.** Damage to the internal circuitry may be caused by the 25A test current, even when *low terminal grounded* is selected for single-ended operation.

**2-2** 12600012\_Gmacd/CB

#### 2.1 ACCESSORIES

The accessories supplied with the instrument are listed in Table 2.1.

Item	Use	Qty
Fuse, 1A, Slo-blo, 20mmX 5mm	Line fuse for 230V power supply	2
Fuse, 2A, Slo-blo, 20mmX5mm	Line fuse for 115V power supply	2
Fuse, 750mA, Slo-blo, 8mmX6mm	Generator (board 15)	2
Fuse, 2A, Slo-blo, 8mm X6mm	Generator (board 14) and front panel	2
Bracket (rack 'ear')	Rack mounting	2
Slide mounting bar	Rack mounting	1
Screw, M4x 12, countersunk	Rack mounting (slide bar fixing)	4
Key	Keyswitch on rear panel	2
50Ω coaxial cable with BNC		
connectors, length 1 metre.		3

Table 2.1 - Accessories

An ac power cable, appropriate to the country of destination, is packed with the instrument. If ordered with the instrument, a telescopic rack slide mounting kit (Option 12505B) is also packed.

#### 2.2 SAFETY

The instrument design accords with the EN61010, 'Safety requirements for electrical equipment for measurement, control and laboratory use'.

This operating manual contains information and warnings, which must be followed:

- a) to maintain the safe condition of the instrument, and
- b) to ensure the safety of the operator.

The principal safety precautions are listed in Section 2.1. Safety precautions are also included, where appropriate, in the operating instructions.

#### 2.2.1 GENERAL SAFETY PRECAUTIONS

- 1. Before switching on:
  - a) Ensure that the power voltage selector is correctly set. (See Section 3.1.)
  - b) Ensure that the power cable is connected to the supply in accordance with the colour code. (See Section 3.3.)
  - c) Ensure that the power cable plug is connected only to a power outlet that has a protective earth contact. This applies equally if an extension cable is used: **the cable must contain an earth conductor.**
- 2. To effect grounding at the instrument front panel, the power plug must be inserted before connections are made to measuring and control circuits. The

power plug or external ground (as appropriate) must remain connected until all measuring and control circuits have been disconnected.

- 3. Any interruption of the ground connection (inside or outside the instrument) is prohibited.
- 4. When the instrument is connected to its supply the opening of covers or removal of parts could expose live conductors. The instrument should be disconnected from all voltage sources before it is opened for any adjustment, replacement, maintenance or repair. Adjustments, maintenance or repair of the instrument when it is powered should not be attempted by the user. Consult a Solartron service center if repairs are necessary.
- 5. Ensure that fuses of the correct rating and type are fitted. The use of makeshift fuses, and short-circuiting of fuse holders, is prohibited.
- 6. Whenever it is likely that the safety of the instrument has been impaired, it should be made inoperative and secured against any unintended operation. Safety could be impaired if the instrument:
  - a) shows visible damage,
  - b) fails to perform intended measurements,
  - c) has been subjected to prolonged storage under unfavourable conditions,
  - d) has been subjected to severe transport stress.

This symbol on the instrument means, "Refer to the operating manual for detailed instructions or safety precautions".

For safety, a ground connection is essential whenever measurement and control circuits are connected, even when the instrument is switched off. The instrument is grounded by connecting it to a power outlet or other suitable earthing point. The ground connection should be capable of carrying 25A.

#### 2.3 ELECTROMAGNETIC COMPATIBILITY

When used as described in this manual the instrument meets the requirements of the EMC Directive. (See Specification in Chapter 1.) It must not be operated with the inner metal screens removed and any replacement components must be of the correct type (see Maintenance Manual.)

When conducting tests at high frequencies the equipment being tested and any unscreened test leads may radiate sufficiently to disturb nearby radio receivers. Since the test signal is sinusoidal, any interference is confined to a very narrow band and problems are unlikely to occur. If, however, interference does become a problem then it is the user's responsibility to reduce emission by the use of suitable screening arrangements.

**2-4** 12600012\_Gmacd/CB

#### 2.4 POWER SUPPLY

#### 2.4.1 POWER VOLTAGE SELECTOR

The instrument can be powered from either a 115V or a 230V ac supply. Before connecting the instrument to the supply, proceed as follows:

1. Set the selector switch on the rear panel to correspond with the voltage of the local ac supply, i.e.

'115V' for supply voltages between 90V and 126V, or

'230V' for supply voltages between 198V and 252V.

2. Insert a fuse of the correct value into the LINE fuse holder.

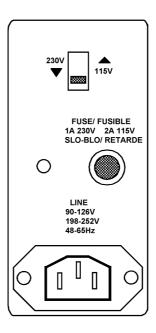

Figure 2.1 - Mains selector panel

#### 2.4.2 LINE FUSE

Only LINE is fused in the instrument. The fuse values for the alternative power voltage settings are:

- a) 1A, 'Slo-blo', for the '230V' setting, or
- b) 2A, 'Slo-blo', for the '115V' setting.

Replacement fuses must be 20mm X 5mm cartridge type.

#### 2.4.3 POWER CABLE

The power cable supplied has an IEC socket on one end (which mates with the power input plug on the instrument) and a power plug, compatible with power sockets in the country of destination, on the other end.

This cable should be connected to the user's ac power supply according to the following colour code:

BROWN = LINE

BLUE = NEUTRAL

GREEN/YELLOW = GROUND

An IEC socket and cable other than the one supplied may be used, but it must be correctly wired as shown in Figure 2.2.

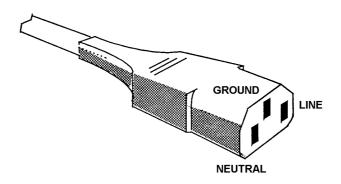

Figure 2.2 - IEC power socket connections

#### 2.4.4 CONNECTION PROCEDURE

- 1. Before connecting the supply, ensure that the power voltage selector on the rear panel is correctly set (see Section 3.1), and that the LINE fuse is correctly rated (see Section 3.2).
- 2. Ensure that the POWER switch on the front panel is set to OFF.
- 3. Connect the power cable.
- 4. Set the instrument POWER switch to ON.

**2-6** 12600012\_Gmacd/CB

#### 2.5 RACK MOUNTING

The instrument can be rack mounted in two ways:

- a) on fixed rails, that support the instrument from the underside of the case,
- b) on telescopic slides.

Method b) allows easy withdrawal of the instrument for servicing.

With either method, the rack mounting ears included in the accessory kit are substituted for the instrument finisher trims. Screws inserted through the ears and into the rack keep the instrument in place.

#### Caution

The rack mounting ears must be used only to prevent the instrument sliding out of the rack. They are not designed to support the whole weight of the instrument.

#### Warning

When the instrument is rack mounted on telescopic slides, ensure that the rack will not tip over when the slides are fully extended.

#### 2.5.1 TELESCOPIC SLIDE MOUNTING KIT (ACCURIDE)

This slide mounting kit is available from Solartron as an optional accessory, and contains:

- a) telescopic slide kit, plus fixings (1 off)
- b) screws, M4x6 panhead, to fix slide inner members to the mounting bars (12 off)
- c) washers, M4 crinkle (12 off)
- d) screws, M6 satin chrome, to fix front panel to rack (2 off)
- e) washers, M6 plain (2 off)
- f) caged nuts, M6, to fix front panel to rack (2 off)

The kit is suitable only for 760mm (30 ins) deep IMHOF IMRAK Series 80 or dimensionally similar cabinets.

#### 2.5.2 RACK DIMENSIONS

The internal rack dimensions required for fitting the instrument are:

- a) 610mm (24ins) deep x 485mm (19 ins) wide, for fixed rail mounting, and
- b) 760mm (30 ins) deep x 485mm (19 ins) wide, for telescopic slide mounting.

#### 2.5.3 VENTILATION

The instrument has fan-assisted cooling. Air is drawn in through slots under the front panel and expelled from the rear panel.

Ensure a free flow of air by allowing adequate clearance between the instrument, the rack in which it is mounted, and any adjacent racked instruments. If the rack is fitted with front doors, these must have vent holes.

#### 2.5.4 FITTING TELESCOPIC SLIDE MOUNTING KIT (ACCURIDE)

- 1. As shown in Figure 2.3, remove the following items from the instrument:
  - a) Finisher Trim,
     Keep the four M4 X 16 panhead screws and M4 crinkle washers for securing the rack ears.
  - b) Handle and Handle Trim,
  - c) Side Trim,
    The side trim is located on the opposite side to the handle. It is normally secured by a pip on the finisher trim and slides out backwards.
  - d) Feet and Tilt Bar.
    The tilt bar is secured by the two front feet.

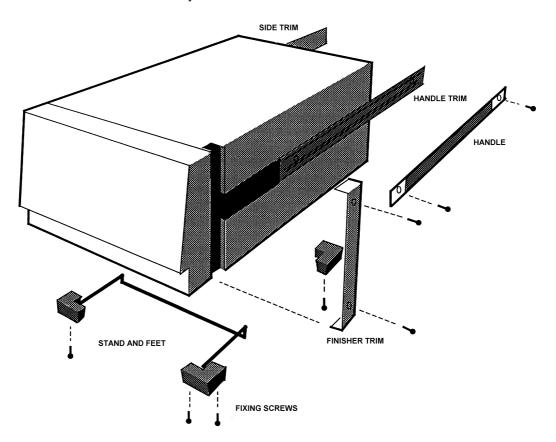

Figure 2.3 - Removal of trims, handle, feet, and tilt bar

**2-8** 12600012\_Gmacd/CB

#### 2. As shown in Figure 2.4, fit the following items to the instrument:

#### a) Rack Ears,

Fit rack ears in place of the finisher trim, using the same fixings. The ears may be fitted in two ways:

- 1. As shown in Figure 2.4.
- 2. With their flanges facing the rear of the instrument. This causes the instrument to stand out further in the rack. 'Blind' units (remote control only) can thus be aligned with locally controllable units.

#### b) Slide Mounting Bar

The slide mounting bar and fittings are included with the instrument accessories. Screw the mounting bar to the chassis in place of the handle, using the four M4x12 countersunk screws provided. The bar fits correctly only one way round; with the threaded holes nearest the front.

The corresponding mounting bar on the left-hand side of the instrument is supplied already fitted behind the side trim; it is slightly narrower than the right-hand bar.

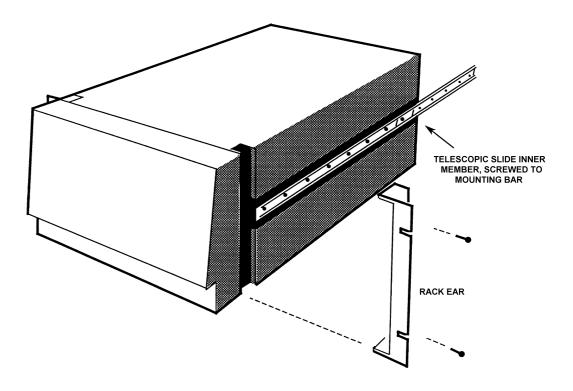

Figure 2.4 - Fitting rack ears and telescopic slide inner members

c) Telescopic Slide Inner Members
The telescopic slides are supplied with inner and outer members slotted together. Slide out the inner member as shown in Figure 2.5, depressing the locking catch at the halfway point.

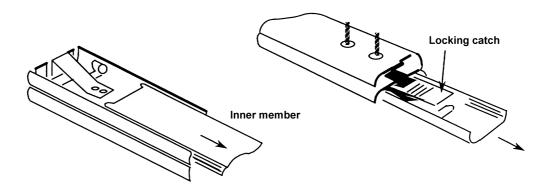

Figure 2.5 - Separating the inner and outer slide members, prior to fixing

Screw the slide inner members to the mounting bars, using the 12 M4x6 panhead screws supplied, 6 each side.

- 3. Fit the following items to the telescopic slide outer members, as shown in Figures 2.6 and 2.7:
  - a) Adjustable Rear Brackets
    Fit one rear bracket to each outer member, but do not fully tighten the screws until the instrument is fitted into the rack (Step 6).

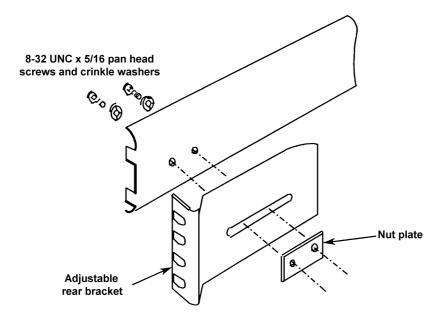

Figure 2.6 - Fitting a rear bracket

**2-10** 12600012\_Gmacd/CB

b) Fixed Front Brackets and Support Brackets.

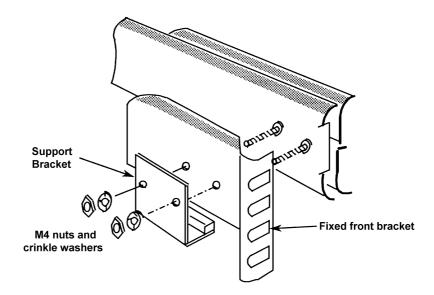

Figure 2.7 - Fitting a front bracket and support bracket

4. Fit the M6 caged nuts for outer slide member and rack ear fixing into the rack, in the positions shown in Figure 2.8. The way to insert and remove caged nuts is shown in the figure detail.

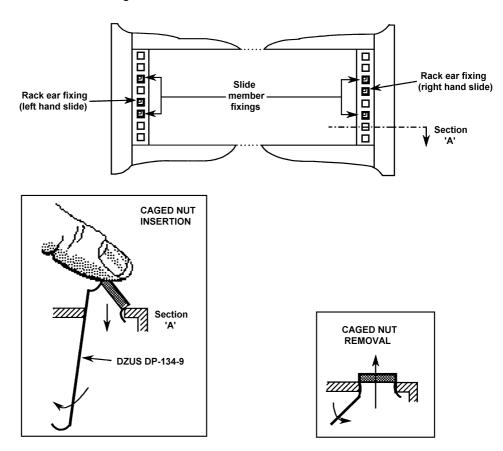

Figure 2.8 - Caged nut insertion in Imrak Series 80 (and similar) cabinets.

5. Fit the outer slide members to the rack, as shown in Figure 2.9.

Note that the tapped holes in the nut plate are positioned off-centre to provide maximum lateral adjustment. Fit the plates, as shown, with the holes offset towards the rack exterior.

Fitting one end of an outer member is made easier if the other end is supported. Hook the bracket at the other end over an M5 screw pushed into the top caged nut.

Tighten the M5 screws securing the outside slide members until each member is held moderately firmly in the rack, approximately in the centre of its travel. The members must, however, be free to take up any adjustment when the instrument is first fitted into the rack.

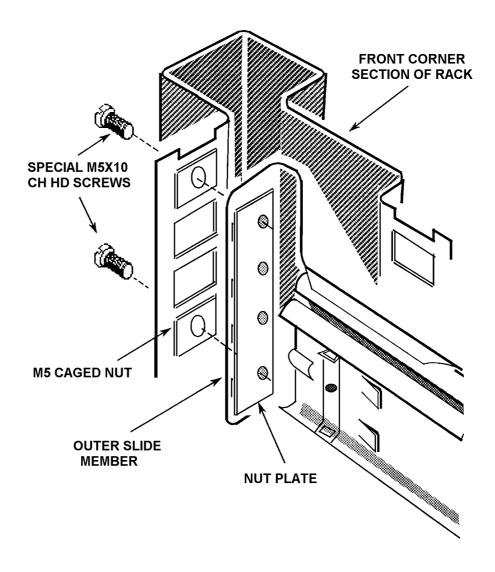

Figure 2.9 - Fitting the outer slide members into the rack

**2-12** 12600012\_Gmacd/CB

- 6. Finally, fit the instrument into the rack, as follows:
  - a) Offer the instrument up to the rack and feed the inner telescopic slide members into the outer members, pushing the instrument into the rack until the locking catches engage and lock.
  - b) Depress both catches and push the instrument fully into the rack, ensuring that no cables are trapped.
  - c) Tighten the screws on the outer slide members in the following order:
    - i) the M5 screws securing the rear bracket to the rack,
    - ii) the M5 screws securing the front bracket to the rack,
    - iii) the 8-32 UNC screws securing the rear bracket to the outer slide member.

#### 2.5.5 FITTING TELESCOPIC SLIDE MOUNTING KIT (JONATHAN)

- 1. As shown in Figure 2.10, remove the following items from the unit:
  - a) Finisher Trim

    Retain the four M4 x 16 panhead screws and M4 crinkle washers for securing the rack ears.
  - b) Handle and Handle Trim
  - c) Side Trim

Located on the opposite side to the handle, the side trim is normally secured by a pip on the finisher trim. The side trim slides out backwards.

Check that the mounting bar already fitted behind the side trim has the part number 12502019B.

d) Case Top and Case Bottom Retain the five screws and washers for securing the replacement case sections.

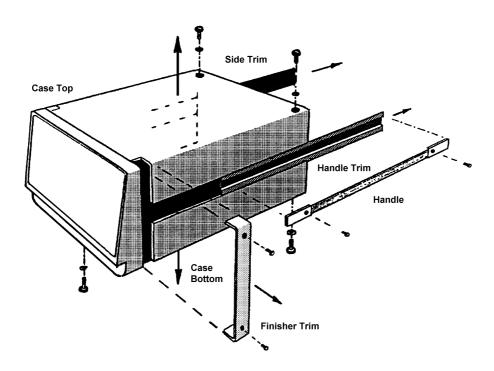

Figure 2.10 - Removal of trims, handle, and top and bottom cases

**2-14** 12600012\_Gmacd/CB

- 2. Fit the self-adhesive feet (four off) to the inside of the replacement case bottom, in the same positions as those in the original case bottom.
- 3. As shown in Figure 2.11, fit the following items to the instrument:
  - a) Rack Ears
     Fit the rack ears in place of the finisher trim, using the same fixings. The flanges must face the rear of the instrument.
  - b) Slide Mounting Bar Screw the bar to the chassis, in the position previously occupied by the handle, using the four M4 x 12 countersunk screws provided. The bar fits correctly one way round only, with the threaded holes nearest the front of the instrument.
  - c) Replacement Case Top and Case Bottom Use the original five screws and washers.
- 4. Fit the Jonathan Telescopic Slide (e.g. the Tru-Glide 110QD-2) and mounting brackets to the instrument, and fit the instrument into the rack. Jonathan slides are not supplied with the instrument. See the manufacturers slide specification sheets for details of fixings, brackets and mounting accessories.

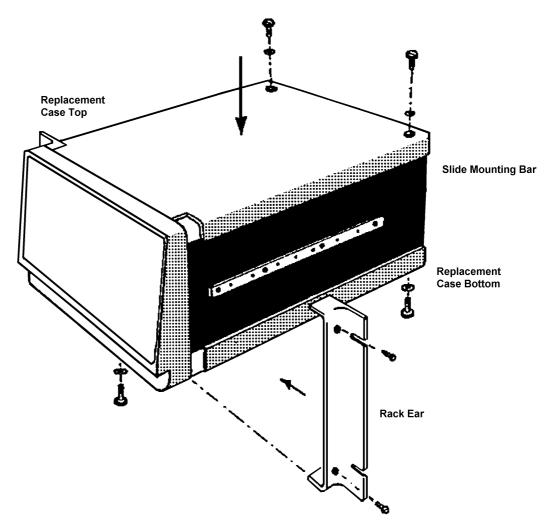

Figure 2.11 - Fitting the rack ears, slide mounting bar, and replacement cases

**3-2** 12600012\_Gmacd/CB

#### 3.1 INTRODUCTION

This chapter introduces the local control features of the instrument and shows you how to use them.

The features of the front panel keyboard are described generally in Sections 2 through 5.

Then, three simple examples in Sections 6, 7, and 8 show:

- · how to make a simple measurement,
- how to make a sweep, and
- · how to plot measurement results.

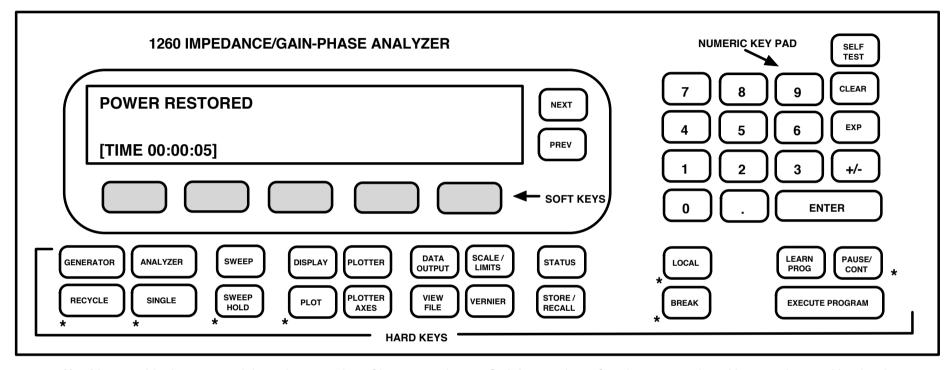

Whilst following the examples, you may find it useful to refer occasionally to Chapter 5, "Menu Terms". Pointers to various sections in this chapter are given in Table 3 1, on page 3.5.

Some of the more advanced uses of the instrument are demonstrated in:

- Chapter 10 Measurement scaling and limits checking.
- Chapter 11 Learnt programs.

#### 3.2 Instrument Keyboard

A logically arranged keyboard and a simple menu structure make the instrument very easy to use.

**Hard keys** guide the user straight to the operation of interest and are used

- a) to command an instant action, e.g. SINGLE (make a single measurement) or
- b) to select a menu of control functions, from which actions may be commanded or control parameters set.

Instant action keys are indicated with an asterisk

A brief summary of each hard key function is given in Table 3.1, with a reference to the relevant section in Chapter 5 "Menu Terms".

**Soft keys**, whose functions are assigned in accordance with a hard key selected menu, allow individual control parameters to be examined and set.

Numeric parameters are entered from the numeric keypad, whilst listed-choice parameters are selected with the NEXT or PREV key.

CLEAR deletes mis-keyed numeric entries, one character at a time, and allows the correct value to be keyed in.

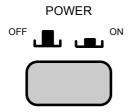

ENTER activates the selected parameter setting.

Table 3.1 - Hard key assignments

Selects the Generator menu. This menu defines the drive signal applied to the item under test: constant voltage/current; frequency, amplitude, and bias; amplitude held constant at generator output or at a selected analyzer input (MONITOR).
Selects the Analysis menu. This menu defines the input parameters of the analyzer, e.g. measurement integration time, delay and mode; input range and coupling.
Commands repetitive measurements.
Commands a single measurement.
Selects the Sweep menu. This menu defines a range of settings through which a selected generator output parameter may be stepped, a new setting being used for each measurement.
Suspends a sweep. The stepped parameter is held at its present setting, whilst measurements continue. To continue the sweep, press SWEEP HOLD again.
Selects the Display menu. This menu defines the measurement results to be displayed. (These results are also sent to the output port(s) enabled from the DATA OUTPUT menu).
Plotter menu. This menu selects: a) the graphics language; b) plot size; c) type of trace, point or vector; d) plot title definition; e) text, grid, axes, on/off.
Commands data to be output from the history file to the GPIB plotter.
Selects the Plotter Axes menu. This menu assigns the displayed data ordinates to the plotter X and Y axes.
Selects the Data Output menu. This menu defines: a) the measurement data output port(s); b) the data to be output, all, fail or pass (ASCII) data, or dump (binary) data; c) port configuration parameters

SCALE/LIMITS (Chap. 5, Sect. 9)	Selects the Scale/limits menu. This menu contains:  a) a measurement normalization facility;  b) a null function, which compensates for stray inductance and capacitance in the input leads;  c) mathematical functions and component sort;  d) a measurement limits check.
VIEW FILE (Chap. 5, Sect. 10)	Opens the View File menu. This gives access to the History File.
VERNIER (Chap. 5, Sect. 11)	Opens the Vernier menu. The vernier facility allows the generator output (or plotter scaling) to be adjusted, whether measurements are being made or not.
STATUS (Chap. 5, Sect. 12)	Selects the Status pages. These pages display control information not available under other hard keys.
STORE/RECALL (Chap. 5, Sect. 13)	Selects the Store/recall menu. This provides for storage and subsequent recall of control settings and measurement results.
LOCAL	Returns the instrument to local control (when it is not in local lockout mode).
BREAK	Switches the generator output off, and suspends any present activities (program, sweep, plot etc.)
LEARN PROGRAM (Chap. 5, Sect. 14)	Opens the Learn Program menu. A learnt program is a series of commands and control set-ups that is memorized by the instrument and executed, in order of entry, when an EXECUTE PROGRAM command is given.
PAUSE/CONT	Pause/continue facility for learnt programs, and control of null compensation.
EXEC. PROGRAM	Starts the execution of a selected learnt program
SELF TEST (Chap. 5, Sect. 15)	Selects the Self Test menu. This offers: a) a self-test facility; b) initialization and reset facilities; c) time set facility; d) error beep on/off

#### 3.3 POWER-UP STATUS

On power-up the instrument is tested automatically and the resulting control status is indicated in a power-up message. This message is important and should be understood before using the instrument. The various messages which may be displayed are:

**POWER RESTORED** The normal power-up message. This shows that the instrument has correctly remembered the control and measurement data that were in its memory when power was interrupted. The generator output is switched off.

**RESET** This message may be displayed if a board has been removed from the instrument. All control settings are set to the default state. Stored parameters, learn programs, and history file data are available for recall.

**INITIALIZED** This message may be displayed if power has been down for a considerable time. All control settings are reset to the default state, and stored parameters, learn programs, and history file data are erased.

A further message may appear with any of the above messages if the instrument needs recalibration:

**"75. CAL DATA CORRUPT"** is displayed if one copy of the calibration data has been corrupted. The instrument is usable, but should be recalibrated as soon as possible.

**"76. RECALIBRATE"** is displayed if both copies of calibration data have been corrupted. The instrument should be recalibrated before further use.

#### 3.4 DISPLAY

Control information or measurement results are displayed, in accordance with the operating state of the instrument. Examples of the display format are shown in Section 5 of this chapter and in Chapter 5 "Menu Terms".

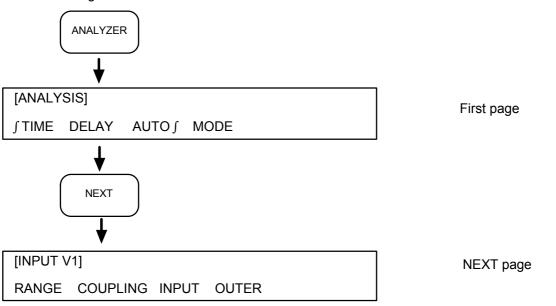

If a bad command is given an error message is displayed also. The meaning of each error message is explained in Chapter 9.

**3-6** 12600012\_Gmacd/CB

#### 3.5 USING A CONTROL MENU

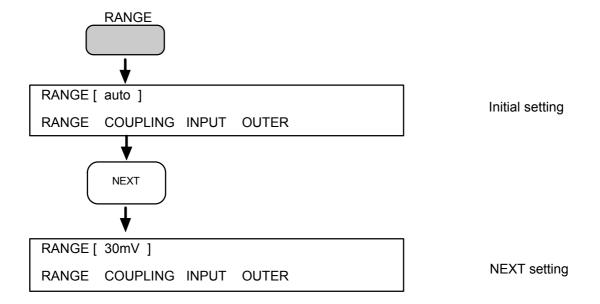

A few simple steps are all that is necessary to use each control menu. You are guided through these by a clear display of the choices available, shown in brackets. The steps are:

 Choose the menu by pressing the relevant hard key. A choice of menu page is indicated by square brackets. Step through the pages by pressing NEXT or PREV e.g.

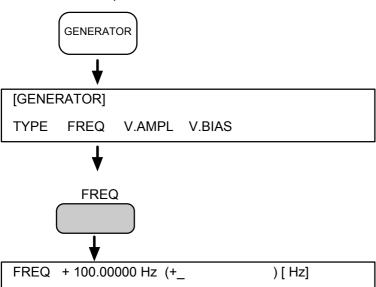

- 2. Access the parameter of interest by pressing the relevant soft key.
- 3. If necessary, choose another setting. A setting is either selected from a list of fixed choices or keyed in as a number from the numeric keypad.

**Listed-choice** parameter settings are enclosed in square brackets and are selected with **NEXT** or **PREV** e.g.

**TYPE** 

**FREQ** 

V.AMPL V.BIAS

numeric parameter entries are invited with round brackets, e.g.

Also displayed is the present parameter value. Numeric values are keyed in from the numeric keypad and appear between the brackets as each number key is pressed. Pressing the CLEAR key deletes the characters in round brackets, one character at a time.

Note that multiples and sub-multiples of the parameter units may often be selected as well, with NEXT or PREV. In the example above this allows frequencies to be entered in  $\mu$ Hz, mHz, Hz, kHz, or MHz.

4. Enter the displayed parameter setting by pressing the ENTER key. This returns the display to the basic menu to allow other parameters to be accessed. A selected setting must be entered for it to be acted on by the instrument; otherwise the setting last entered (or the default setting) is used.

### **POINTS TO REMEMBER:**

- Square brackets enclose one item in a list of choices. Select other settings with the NEXT key (down the list) or PREV (up the list). Square brackets may enclose menu page titles, control settings, or units of control settings. Press the ENTER key to update the selection.
- **Round brackets** invite the entry of a **number** from the numeric keypad. Press the ENTER key to update the number.

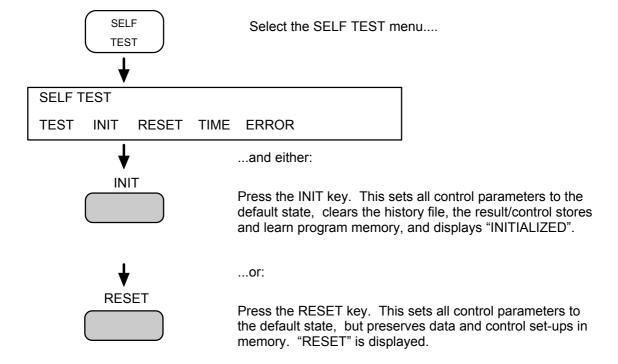

**3-8** 12600012\_Gmacd/CB

# 3.6 MAKING A SIMPLE MEASUREMENT

In this example the impedance of a simple *C*,*R* network is measured at a single defined frequency and the results of analysis are displayed.

### 3.6.1 PRELIMINARIES

- 1. Ensure that the instrument is correctly installed, as described in Chapter 2.
- 2. Switch on the power, at source and on the instrument front panel. Check that the "POWER RESTORED" message is displayed. If it is, proceed with the example if it isn't, refer to Section 2 in this Chapter.
- 3. Reset or initialize the instrument. This sets the control-parameters to a known state, from which setting up may begin. Before initializing, ensure that you will not be deleting any useful data, or control set-ups. To retain stored data and control set-ups in memory, reset the instrument instead. The procedure is:

### 3.6.2 CONNECTING THE ITEM UNDER TEST

Items under test may be connected to the instrument either directly through the front panel terminals or through one of the test modules that fit over the terminals.

The easiest way of connecting the *C,R* network presently under test is through the component test module, as shown in Fig 3.1.

Measurement connections, generally, are described in Chapter 6.

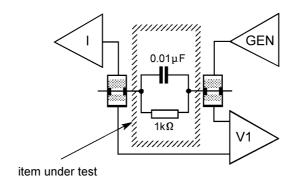

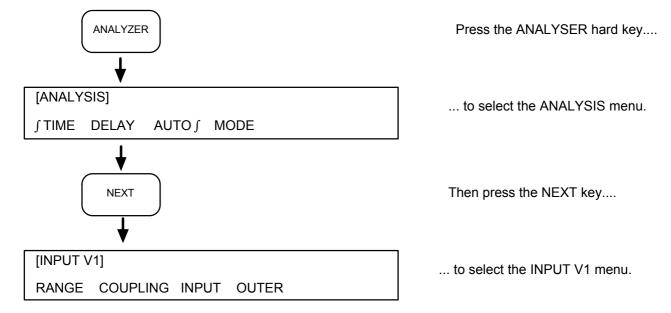

Fig 3.1 - Connections for a simple impedance measurement

To complete the measurement connections the analyzer inputs must be configured to suit the test module. This is done from the ANALYZER menu.

# 3.6.3 SETTING THE ANALYZER

The analyzer parameters should be set in accordance with the test set-up and the expected test response.

In the present example all the analyzer parameters are left at their default settings (shown in Table 3.2), with the exception of OUTER for the VOLTAGE 1 input. This parameter is altered to floating ground, as follows:

**3-10** 12600012\_Gmacd/CB

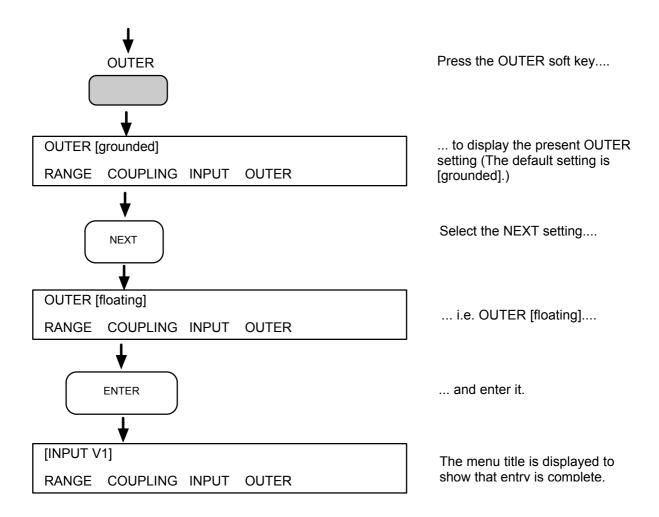

Table 3.2 - Analyzer Default Settings

Parameter	Setting	Characteristics
[ANALYSIS]  ∫TIME  DELAY  AUTO ∫  MODE	200ms zero secs off. normal	Suitable for low noise input. Suitable for the item under test. UT has constant low noise input: auto integration not required. Suitable for all display coordinates, except r,t and r (dB), t. There is no need for the auto impedance facility, as the form of the circuit is known.
[INPUT V1] RANGE COUPLING INPUT	auto dc differential	Covers all input voltage ranges. IUT gives no dc component at voltage 1 input, therefore dc coupling is used for minimum phase shift. Differential input (Hi - Lo).
OUTER	grounded	Screens grounded. (Altered to screens floating in this example.)
[INPUT V2]		Same settings as [INPUT V1].
[INPUT II RANGE COUPLING	auto dc	Covers all input current ranges. IUT gives no dc component at CURRENT input, therefore dc coupling is used for minimum phase shift.

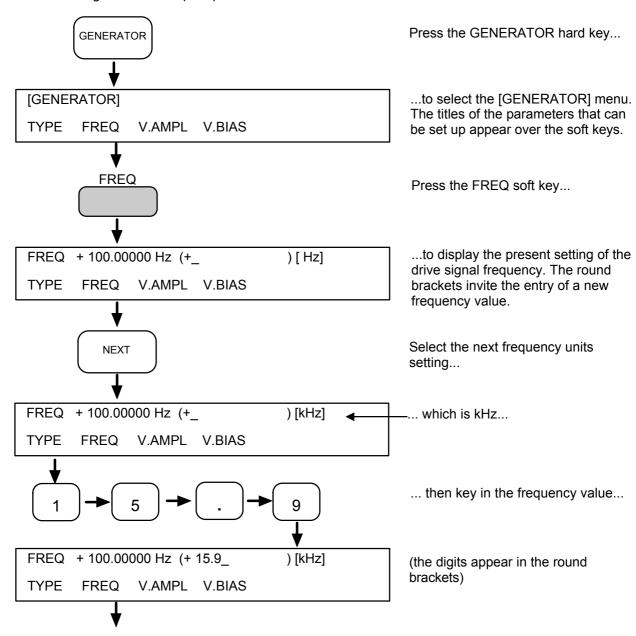

### 3.6.4 SETTING THE GENERATOR

Set the generator parameters to provide a suitable drive for the item under test (IUT). Remember that the drive specified must satisfy:

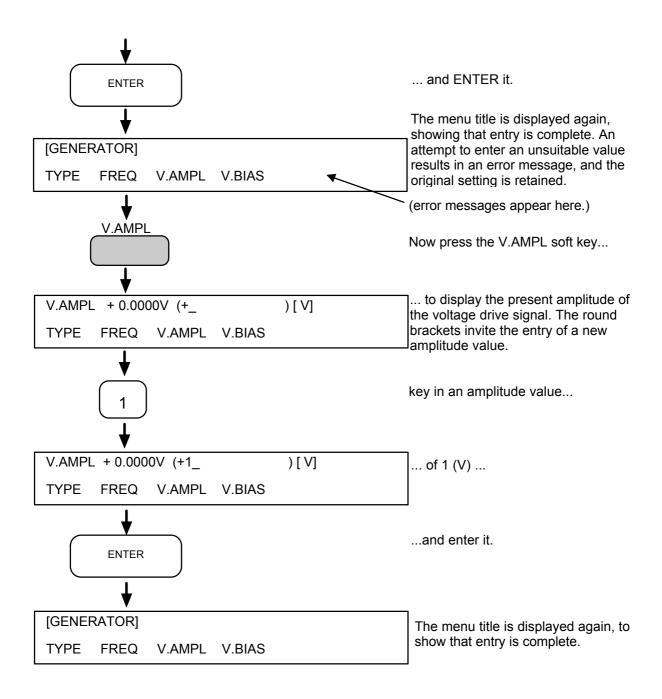

- · the generator output capability,
- · the rating of the JUT, and
- · the analyzer input range.

In the present example the IUT is driven at a frequency of 15.9kHz. At this frequency the impedance of the circuit is approximately  $707\Omega$ , and a drive amplitude of 1V (applied both to the item under test and to the analyzer VOLTAGE 1 input) develops a drive current of approximately 1.4mA. The drive and expected test response are thus well within the capabilities of the generator and analyzer.

The generator set-up sequence is:

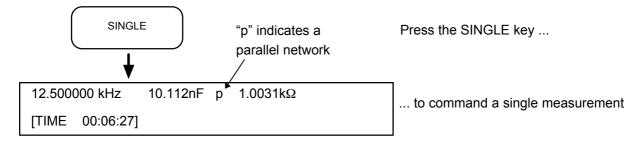

**3-12** 12600012\_Gmacd/CB

The generator parameters are now set, but the generator output is not applied to the IUT until a measurement is commanded. See next page.

# 3.6.5 COMMANDING A MEASUREMENT

Once the generator and analyzer have been set up it is possible to command a measurement and get some sensible results.

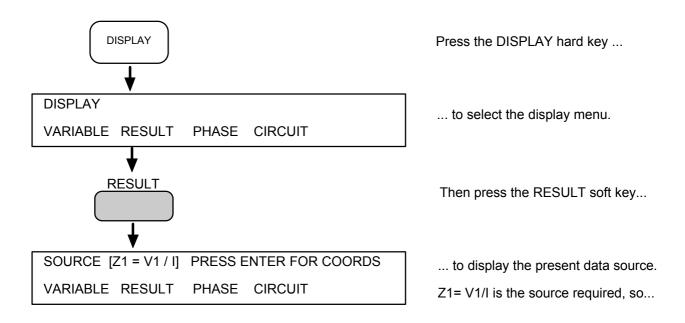

On completion of the single measurement the instrument displays the component values of the parallel *C,R* circuit presently under test. This is the default display. Other measurement sources and coordinates may be selected from the DISPLAY menu.

Note that the generator output is switched on, and stays on, when a measurement is first commanded. BREAK switches the generator output *off*.

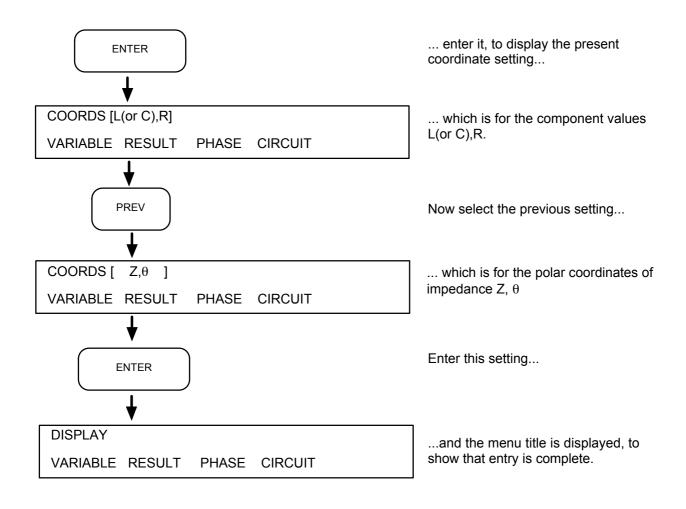

### 3.6.6 SETTING THE DISPLAY

Once a measurement has been made the basic data are stored in memory. From these basic data the instrument is able to compute various results in various formats: you simply select the appropriate result from the DISPLAY menu. This allows the same measurement data to be viewed in many different ways.

The next example, in Section 7, shows you how to use the sweep facility. A series of measurements is made, each one at a different frequency, in preparation for making an impedance plot. As an exercise, use the DISPLAY menu to select the polar coordinates  $Z,\theta$ . (You may, if you wish, do this after the swept measurements are made, but selecting coordinates  $Z,\theta$  now allows you to see the changing impedance results as they occur.) The procedure is:

**3-14** 12600012\_Gmacd/CB

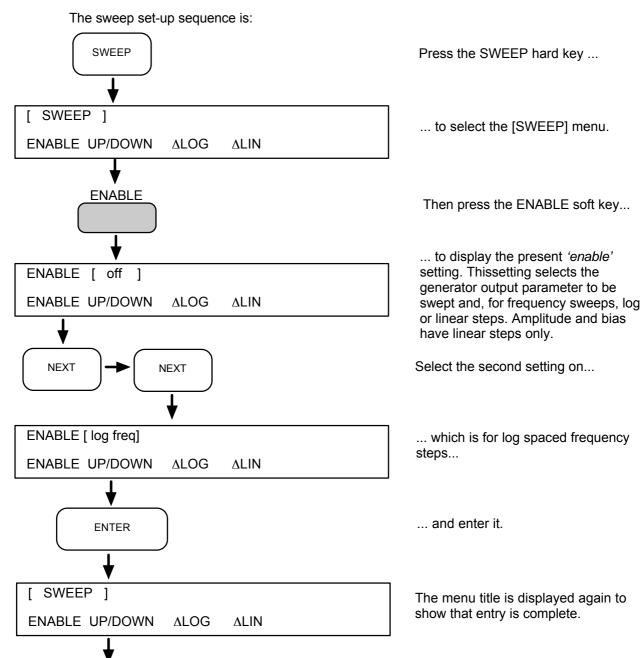

# 3.7 USING THE SWEEP FACILITY

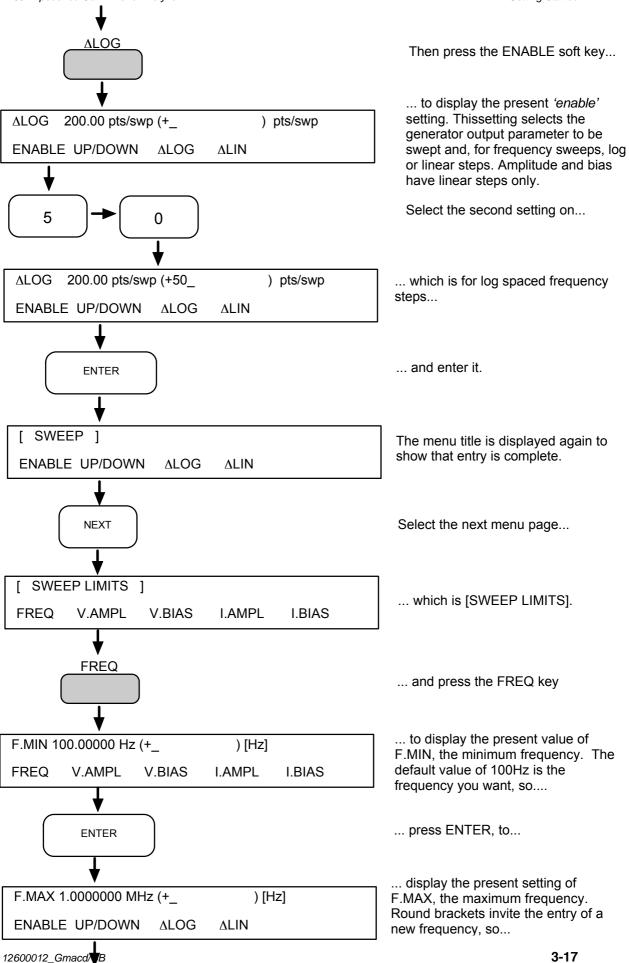

SWEEP allows any one of the generator output parameters, frequency, amplitude, or bias, to be stepped through a range of settings, a new setting being used for each measurement. The basic data of the series of measurements thus made are held in the history file and may be reviewed with the VIEW FILE facility. A graph can be plotted from the stored data with the PLOT facility (example in Section 8).

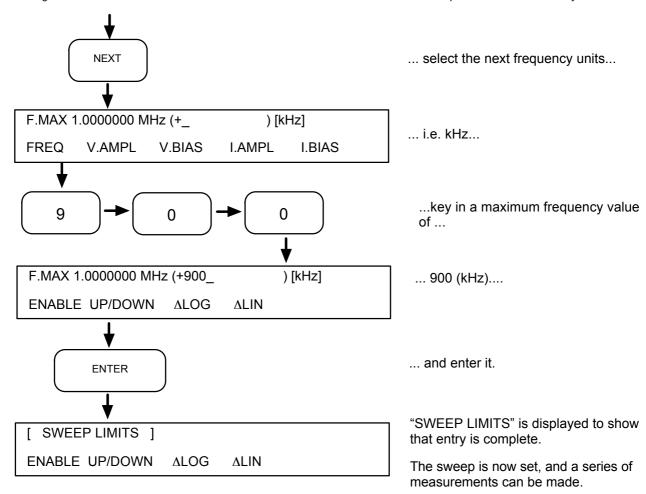

In the following example a series of measurements is made of the C,R circuit shown in Fig 3.1, using a frequency sweep. (The settings of the GENERATOR, ANALYZER and DISPLAY menus are the same.) The frequency is swept between the limits 100Hz (F.MIN) and 900kHz (F.MAX). Fifty measurements are made, at logarithmic intervals, going from the minimum to the maximum frequency.

# 3.7.1 SETTING THE SWEEP

**3-16** 12600012\_Gmacd/CB

# 3.7.1.1 Effect of Sweep on Generator Loading

Before actually commanding a sweep it is wise to consider how the variation in drive frequency will affect the generator loading.

In the present example a constant drive amplitude of 1V is used. The impedance of the item under test decreases with frequency, therefore we should look at the loading at 900kHz. At this frequency the reactance of the capacitor (=  $1/\omega$ C) 17.70. The effect of the 1k $\Omega$  parallel resistance is negligible, so the impedance of the item under test  $\approx 17.7\Omega$ . The current drain on the generator output will thus be around 56.5mA, which the generator can supply (max. ac- current output = 60mA). To keep the test current within reasonable bounds at the higher test frequencies a lower drive voltage should be selected: two or more consecutive sweeps, each covering part of the test band and using a suitable drive voltage, can be set up with a *learnt program* (See Chapter 11).

You can, of course, select a constant current drive, by entering [current] under the GENERATOR TYPE. Then, with the present item under test, you should consider the current at the low frequency end of the sweep: the impedance of the item at 100Hz approaches  $1k\Omega$ , therefore the highest test current which can be obtained, at this frequency, is 3mA. (The maximum drive voltage is 3V.)

**3-18** 12600012\_Gmacd/CB

### 3.7.2 PREPARING THE HISTORY FILE

The flow of data to the history file is controlled from the DATA OUTPUT menu. For the present example the default settings are used. As a result:

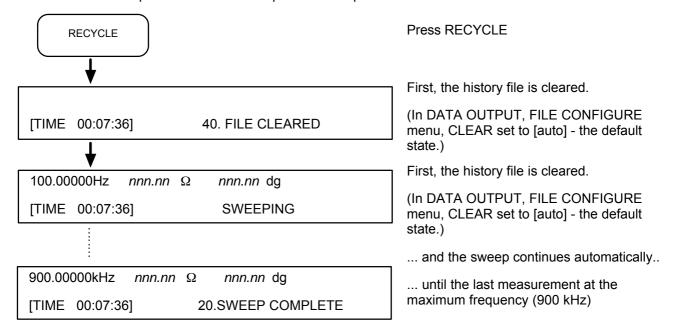

- the file is cleared automatically at the beginning of sweep....
  (CLEAR set to [auto] on [FILE CONFIGURE] page)
- > and, as the sweep progresses, the basic data of *all measurements* are filed.... (FILE set to [all] on [DATA OUTPUT] page)
- in normal format. (FORMAT set to [normal] on [FILE CONFIGURE] page)

# 3.7.3 Commanding a Series of Measurements

To complete a sweep, a measure command must be given for each point defined in the SWEEP menu.

SINGLE commands advance the sweep one measurement at a time, and allow measurement results to be assessed as they occur.

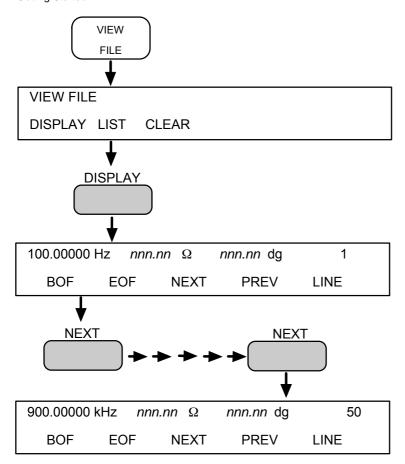

RECYCLE advances the sweep automatically. The measurement results can be assessed on sweep completion by reading them from the history file, with the VIEW FILE facility. This is the procedure used in the present example:

The measurement results may now be read from the history file.

### 3.7.4 READING THE HISTORY FILE

The history file contains the basic data of all measurements made in the sweep. For each measurement the data are stored in a specific file location, known as a *line*. The first measurement data are stored on line #1, the second on line #2, and so on. File locations may be accessed in any order from VIEW FILE. The form of the measurement results obtained from the basic data is selected from the DISPLAY menu. The results may be displayed in any order. They can, for example, be displayed in measurement order:

Press VIEW FILE...

... to access the file control keys.

Then press DISPLAY...

- ... to display a result from line #1...
- ... and the file display functions.

Using NEXT, step to each location in turn, until...

... the line at the end of the file (EOF) is reached (e.g. #50).

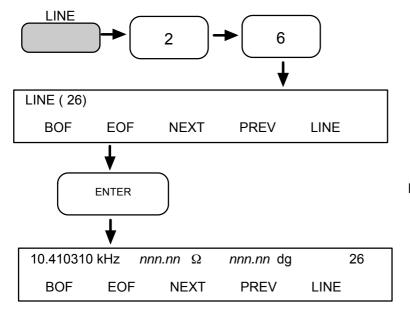

The functions of the other DISPLAY keys are:

PREV Steps through the file in reverse order.

BOF Displays line #1

EOF Displays the highest numbered line containing data.

LINE Displays the results on a specified line number.

Press LINE and key in the line number.

Enter the line number...

... and the result is displayed.

# 3.8 USING THE PLOT FACILITY

With the present example a Z, $\theta$  plot may be made of the sweep results (stored in the history file) simply by pressing the PLOT key. This assumes, of course, that a digital plotter, suitably set up, is connected to the instruments GPIB interface. Other types 'of plot, e.g. R,X may be made from the same basic data. The procedures for making a Z, $\theta$  plot and an R,X plot are given below.

The appearance of a plot may be changed from the PLOTTER menu. For example, the results can be plotted as points rather than joined by straight lines, a grid can be printed over the plot to assist in interpreting the results, and the plot can be given a title. (See Chapter 5, Section 5.)

Measurement results may also be plotted as they occur. For this, however, the plotting field must be set manually, from the PLOTTER AXES menu. (See Chapter 5, Section 7.)

# 3.8.1 MAKING A Z, PLOT OF THE HISTORY FILE DATA

This example uses the data acquired in the previous example. A digital plotter, using HPGL (Hewlett Packard Graphics Language), is connected to the GPIB interface. (For plotters using ESGL (Enertec Schlumberger Graphics Language) the DEVICE setting in the PLOTTER menu must be set to [ESGL].)

### 3.8.1.1 Installing the GPIB Plotter

At the GPIB interface on the rear panel, set the *talk* only switch to ON, press BREAK, and plug a digital plotter into the GPIB connector. (See Fig 3.2.) Ensure that the plotter is set to *listen only*, as described in its operating manual.

Switch the plotter on and load a clean sheet of paper onto the platten.

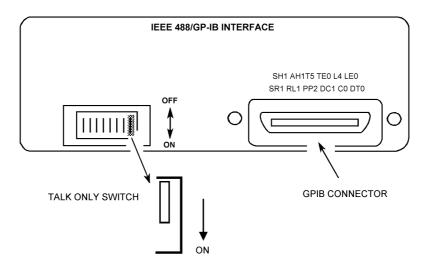

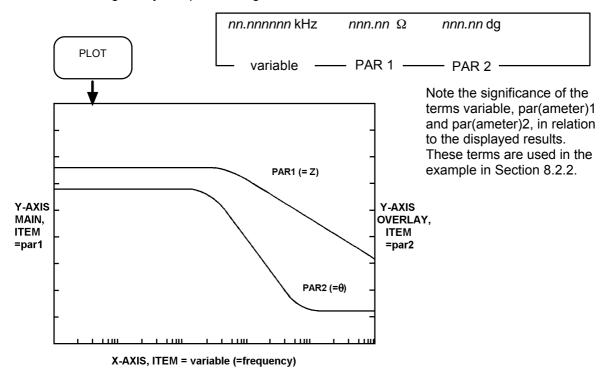

Fig 3.2 - Setting the instrument to "talk only".

# 3.8.1.2 Commanding the Z,q plot

Press the PLOT key and the pen should move from the parking position to the top right corner of the plotting area; this shows that something is happening. Then, after a short "thinking" delay, the plot will begin.

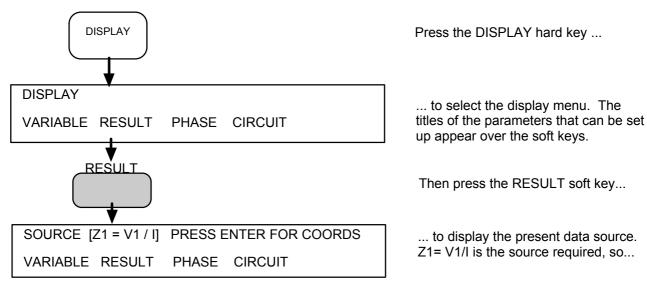

# 3.8.2 MAKING AN R,X PLOT OF THE HISTORY FILE DATA

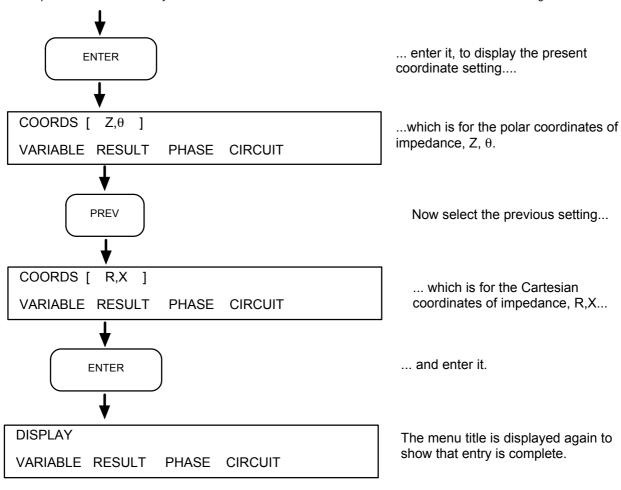

To make an R,X plot, the R (resistance) and X (reactance) coordinates must first be selected as the displayed result. The two coordinates must also be assigned to the plotter X- and Y-axes.

### 3.8.2.1 Setting the Display Coordinates

Use the DISPLAY menu to select the *R*,*X* coordinates:

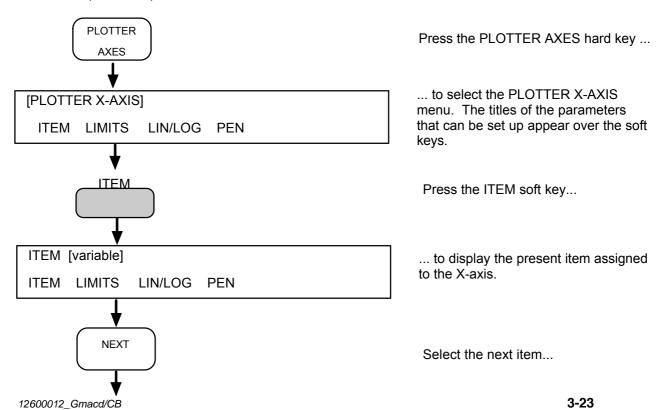

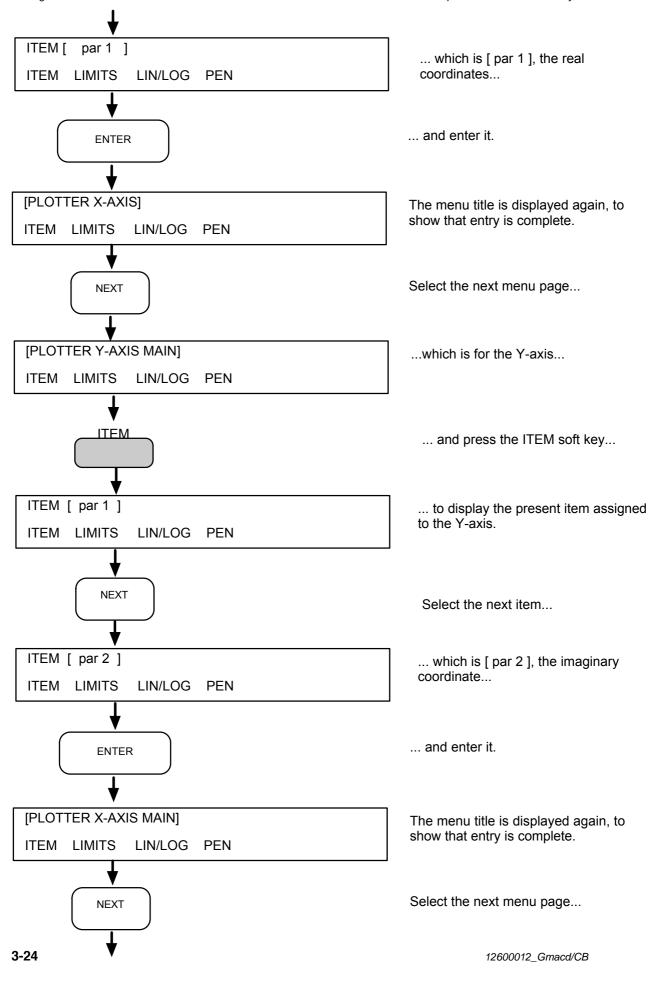

**3-22** 12600012\_Gmacd/CB

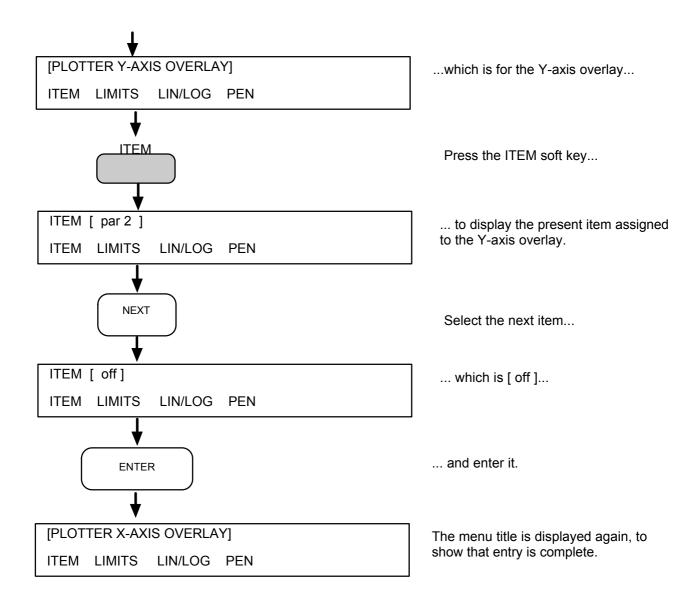

# 3.8.2.2 Setting the Plotter Axes

Use the PLOTTER AXES menu to assign the R (resistance) coordinate to the X-axis and the X (reactance) coordinate to the Y-axis.

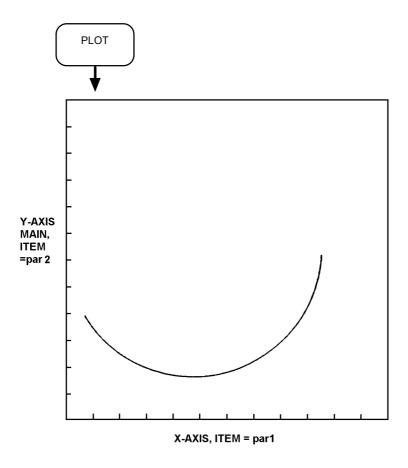

Now command the *R*, *X* plot, as shown overleaf.

# 3.8.2.3 Commanding the R,X Plot

To start the R,X plot press the PLOT key:

**3-26** 12600012\_Gmacd/CB

4-1 12600012\_Gmacd/CB

# 4.1 MENU SUMMARY

This summary is intended as a memory aid for experienced users.

Numeric parameters are indicated by round brackets. The generator output frequency, for example, appears thus:

FREQ (+ )

Where applicable, the range and default values of a numeric parameter are shown against it. For example, the range and default values of the generator output frequency are shown thus:

10μHz to 32MHz; default=100Hz.

The absence of a default value generally indicates that a parameter defaults to zero.

With listed choice parameters the full list of settings is shown, with the default setting enclosed in square brackets. For example, the choice of frequency units available for the generator output is shown thus:

[Hz] • kHz • MHz • μHz • mHz

# Current Limit of Generator Output

The current limit curves shown above result from the voltage compliance limit of the current generator (3 volts rms) and the amplitude limit (60mA for 10MHz and below; 20mA for above 10MHz). The ac curve fits the limit

$$|I_{\text{max}}| \times (50\Omega + |Z|) \le 3 \text{Vrms}$$

Similarly the curve for BIAS current is subject to a voltage compliance of 45 volts and a current limit of 100mA peak. The bias curve fits the limit

with an upper limit of 100mA.

Note that the BIAS limit is for BIAS + AC peak and that the impedance-AC-BIAS combination chosen must satisfy the limits for both AC and BIAS.

**5-2** 12600012\_Gmacd/CB

# 5.1 GENERATOR

The generator drives the item under test (IUT). The drive signal parameters are shown in Figure 5.1.

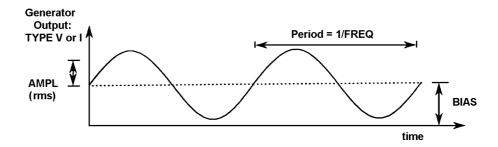

Figure 5.1 - Drive signal parameters

# **5.1.1** [GENERATOR]

Type of drive and constant voltage drive parameters.

**TYPE** Selects constant voltage or constant current drive:

• [voltage] Constant voltage drive:

With MONITOR ENABLE set to [monitor off] the amplitude of the generator output voltage is held at the VAMPL value.

With MONITOR ENABLE set to [monitor V1, target = V AMPL] the generator output is varied between 0V and V LIMIT in an attempt to hold the analyzer VOLTAGE 1 input at the V AMPL value.

With MONITOR ENABLE set to [monitor 1, target = I AMPL] the generator output is varied between 0V and V LIMIT in an attempt to hold the analyzer CURRENT input at the I AMPL value.

• [current] Constant current drive:

With MONITOR ENABLE set to [off] the amplitude of the generator output current is held at I AMPL value. (Set up the drive current parameters from the [GENERATOR Cont] page.)

With MONITOR ENABLE set to [monitor V1, target = V AMPL] the generator output is varied between 0mA and I LIMIT in an attempt to hold the analyzer VOLTAGE 1 input at the V AMPL value.

With MONITOR ENABLE set to [monitor I, target = I AMPL] the generator output is varied between 0mA and I LIMIT in an attempt to hold the analyzer CURRENT input at the I AMPL value.

- FREQ Frequency of generator output. This is selectable in the range  $10\mu Hz$  to 32MHz. To vary the frequency progressively, use SWEEP.
- **V. AMPL** Constant voltage ac amplitude, in the range 0V to 3V rms ( $f \le 10$ MHz) and 0V to 1V (f > MHz).
- **V. BIAS** Constant voltage dc level, in the range -40.95V to =40.95V. Used for setting the quiescent operating point of the IUT or for nulling a dc offset.

# 5.1.2 [GENERATOR Cont]

Type of drive and constant current drive parameters.

**TYPE** Selects constant voltage or constant current drive. Duplicate of TYPE in Section 1.1 above.

**FREQ** Frequency of generator output. Duplicate of FREQ in Section 1.1 above.

**I AMPL** Constant current ac amplitude, in the range 0mA to 60mA rms ( $f \le 10$ MHz) and 0mA to 20mA rms (f > 10MHz).

I BIAS Constant voltage dc level, in the range -I00mA to + I00mA. Used for setting the quiescent operating point of the IUT or for nulling a dc offset.

# **5.1.3** [MONITOR]

Constant input signal parameters.

**ENABLE** Selects a constant signal level at the analyzer VOLTAGE 1 or CURRENT input. (In monitor mode the displayed amplitude variable represents the actual generator output.)

### [monitor off]

Monitor facility off: generator output held at V AMPL or I AMPL value, in accordance with TYPE setting. (See Sections 1.1 and 1.2 above.)

# [monitor V1, target = V. AMPL]

Constant voltage input. Generator output is adjusted automatically to hold the analyzer VOLTAGE 1 input at V AMPL ±ERROR%. During this process the generator output is not allowed to exceed the V LIMIT value.

### [monitor I, target = I. AMPL]

Constant current input. Generator output is adjusted automatically to hold the analyzer CURRENT input at I AMPL ± ERROR%. During this process the generator output is not allowed to exceed the I LIMIT value.

**V LIMIT** Maximum amplitude voltage allowed at generator output in [monitor V1, target = V. AMPL] mode. (Default value = 3V.)

I LIMIT Maximum amplitude current allowed at generator output in [monitor I, target I. AMPL] mode. (Default value 60mA.)

**ERROR%** Percentage difference (1% to 50%) allowed between the generator output and the target value, in monitor mode.

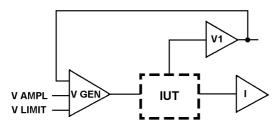

A failure to obtain a target value within the defined error percentage (after two attempts) results in the error message "84. MONITOR FAILED".

# 5.1.4 MONITOR CONFIGURATIONS

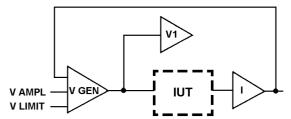

To hold an input signal at a constant level the instrument uses one of the feedback configurations schematized in Fig 5.2. These configurations are part hardware and part software and, excluding the IUT, are contained in the instrument. In each case the generator output is varied, within defined limits, to maintain the selected input at a defined level. An amplitude sweep with monitor enabled sweeps the selected input.

**5-4** 12600012\_Gmacd/CB

 VOLTAGE 1 input maintained by voltage generator. (Generator TYPE [voltage]; ENABLE [monitor V1])

b) CURRENT input maintained by voltage generator. (Generator TYPE [voltage]; ENABLE [monitor I])

 VOLTAGE 1 input maintained by current generator. (Generator TYPE [current]; ENABLE [monitor V1])

d) CURRENT input maintained by current generator. (Generator TYPE [current]; ENABLE [monitor I])

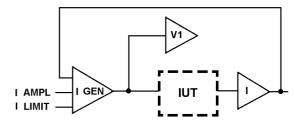

Figure 5.2 - Simplified schematic of monitor feedback configurations

# 5.1.5 GENERATOR START AND STOP CONTROL

The generator output is switched on, and stays on, when a measurement, SINGLE or RECYCLE, is commanded or when NULL [evaluate] or NORMALIZE [evaluate] is commanded.

BREAK switches the output off.

Other commands that switch the generator output off are:

**KILL** 

This remotely generated signal is applied to a connector on the rear panel. When asserted, it holds the generator output at zero volts; when released, it allows the excitation signal to assume its set amplitude.

KILL also halts measurement data processing. Processing restarts, after KILL is released, with the next complete measurement.

Note that, with low frequency measurements, you may have to wait a considerable time for the measurement results to appear. For example, when measuring at 1mHz, the present ("killed") measurement will take up to 1000 secs to complete. Then, assuming KILL was released during this period, you will have to wait another 1000 secs for the results of the "released" measurement.

SELF TEST Same action on generator output as BREAK.

RESET Sets the AMPL value in the GENERATOR menu to zero.

INITIALIZESame action on generator output as RESET.

# 5.2 ANALYZER

The analyzer correlates the input signals V1,V2, and I at the drive signal frequency to obtain the frequency response and impedance of the item under test. From these basic measurement data the instrument can compute many different results in various formats: you select the result of your choice from the DISPLAY menu. Any scaling that may be necessary is selected from the SCALING menu: this includes nulling, normalisation, end scaling by functions. Limits checking and sorting of the results may be selected from the LIMITS and BINSORT menus.

The basic analysis data are stored in the history file (when this is enabled, from the DATA OUTPUT menu) and may be reviewed with the VIEW FILE facility.

# **5.2.1** [ANALYSIS]

Parameters common to all analyzer inputs. The DELAY and ∫ TIME parameters are shown in Figure 5.3.

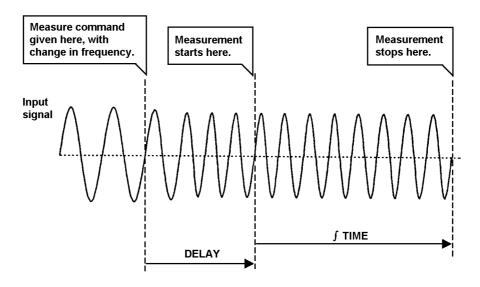

Figure 5.3 - Measurement delay and integration time

### 5.2.1.1 ∫ TIME

Integration time. The period over which the analyzer measures the input signals. The duration of this period determines the harmonic and noise rejection ability of the analyzer. Defined in seconds, the time is rounded up or down to cover a whole number of cycles. Figure 5.4 shows how rejection increases with time.

The integration time can be adjusted automatically, in accordance with the amount of noise present at the input and the statistical accuracy required for the measurement result. See Section 2.1.3.

### 5.2.1.2 DELAY

Delays the start of a measurement on the measure command. Typically, used with SWEEP. Allows the response of the item under test to settle after a change in drive.

**5-6** 12600012\_Gmacd/CB

### 5.2.1.3 *AUTO*

Auto integration. Selects an integration time in keeping with the interference on a selected input. Measurement continues, within the ∫ TIME period, until the standard deviation of the input data reaches a target value:

### [off]

Auto integration off. Analyzer inputs measured over ∫ TIME.

### [Long ∫ on V1]

Aims for a standard deviation of  $\pm 1\%$  of reading  $\pm 0.001\%$  of full scale on analyzer VOLTAGE 1 input.

### • [Short ∫ on V1]

Aims for a standard deviation of  $\pm 10\%$  of reading  $\pm 0.01\%$  of full scale on analyzer VOLTAGE 1 input.

### • [Long ∫ on V2]

Aims for a standard deviation of  $\pm 1\%$  of reading  $\pm 0.001\%$  of full scale on analyzer VOLTAGE 2 input.

### [Short ∫ on V2]

Aims for a standard deviation of  $\pm 10\%$  of reading  $\pm 0.01\%$  of full scale on analyzer VOLTAGE 2 input.

### [Long ∫ on I]

Aims for a standard deviation of  $\pm 1\%$  of reading  $\pm 0.001\%$  of full scale on analyzer CURRENT input.

### [Short ∫ on I]

Aims for a standard deviation of  $\pm$  10% of reading  $\pm$  0.01% of full scale on analyzer CURRENT input.

In each case, the standard deviation value can be accepted with 90% confidence. A failure to reach the required deviation value within the  $\int$  TIME is indicated by the message "82. AUTO INT. FAILED".

To ensure that the standard deviation of all input data is equal to or less than one of the values stated above, select the input signal with the most interference for auto integration.

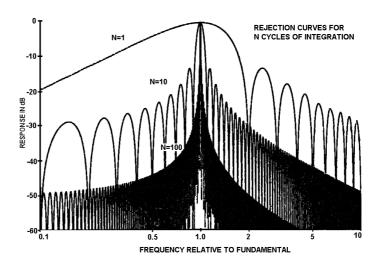

Figure 5.4 - Noise and harmonic rejection v cycles of integration

#### 5.2.1.4 MODE

Selects a measurement mode suitable for the results to be displayed (see Section 4).

#### [normal]

Single measurement. Used for all displayed functions, except r,t, r(dB), t, and auto circuit.

### • [group delay]

Triple measurement. Used for the functions r,t and r(dB), t, whose prime purpose is to determine the transmission quality of filters. *Time t represents the delay between the frequencies F - n% and F+p%. F*, the generator output frequency, and the values n and p are all defined by the user. All other display functions, except *auto circuit*, may be derived from group delay measurements.

The error incurred in a group delay measurement

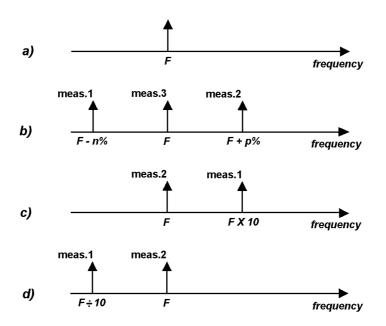

$$= \frac{phase\ error\ (in\ deg\ rees)}{360\ x\ f_{span}}$$

where 
$$f_{span} = F(n+p)Hz$$

This shows that the group delay error is inversely proportional to  $f_{span}$ . To minimize the group delay error at the lower drive frequencies, increase the values of n and p as the value of F is decreased.

## · [auto impedance]

Double measurement. Used primarily for the auto circuit function, but can also be used for any other function except r,t and r(dB),t.

F = Generator FREQ value

Figure 5.5 - Measurement modes: a) normal, b) group delay, c) auto impedance (F < 128Hz), d) auto impedance (F ‡ 128Hz)

**5-8** 12600012\_Gmacd/CB

# 5.2.2 [INPUT V1]

Parameters of the analyzer VOLTAGE 1 input.

#### 5.2.2.1 RANGE

Auto ranging or a fixed range can be used:

## • [auto]

Auto ranging selects the most accurate range for the signal amplitude being measured. Each measurement starts on the most sensitive range. If an overload is detected the result is discarded and measurement restarts on the next range up; this procedure is continued until a valid result is obtained.

Auto ranging should be used when the signal amplitudes being measured cover more than one input range, or are unpredictable.

### • [30mV]

Fixed range for signal amplitudes between 0V and 30mV.

#### • [300mV]

Fixed range for signal amplitudes between 0V and 300mV.

## • [3V]

Fixed range for signal amplitudes between 0V and 3V.

The use of a fixed range avoids the range search time penalty incurred with auto ranging. Select the most sensitive range possible, to obtain the finest measurement resolution.

## **5.2.2.2 COUPLING**

Coupling of the measured signal to the analyzer VOLTAGE 1 input.

#### [dc]

Dc coupling introduces minimum phase shift and should be used whenever possible, particularly on low frequency work.

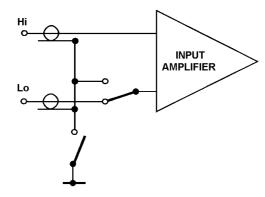

#### [ac]

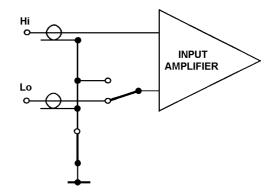

Ac coupling can be used to reject an unwanted dc component. This may allow a more sensitive input range to be selected.

# 5.2.2.3 INPUT AND OUTER

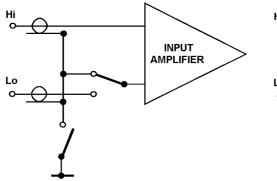

These settings select the internal connections between the Hi and Lo voltage inputs and the analyzer input amplifier:

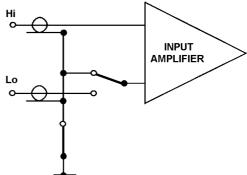

- a) INPUT = diff; OUTER = floating
- b) INPUT = diff; OUTER = grounded

- c) INPUT = single; OUTER = floating
- d) INPUT = single; OUTER = grounded

# 5.2.3 [INPUT V2]

Same parameters as for [VOLTAGE 1], but applicable to the VOLTAGE 2 input.

5-10 12600012\_Gmacd/CB

# 5.2.4 [INPUT I]

Parameters of the analyzer CURRENT input.

# 5.2.4.1 RANGE

Auto ranging or a fixed range can be used:

## • [auto]

Auto ranging selects the most accurate range for the signal amplitude being measured. Each measurement starts on the most sensitive range. If an overload is detected the result is discarded and measurement restarts on the next range up; this procedure is continued until a valid result is obtained.

Auto ranging should be used when the input signal amplitudes cover more than one range, or are unpredictable.

#### • [6µA] to [60mA]

A fixed range provides for the measurement of signal amplitudes in the range:

- ♦ 0 to 6μA,
- 0 to 60μA,
- 0 to 600μA,
- ♦ 0 to 6mA.
- ♦ 0 to 60mA,

The use of a fixed range avoids the range search time penalty incurred with auto ranging. Select the most sensitive range possible, to obtain the finest measurement resolution.

#### **5.2.4.2 COUPLING**

Coupling of the measured signal to the analyzer CURRENT input.

### [dc]

Dc coupling introduces minimum phase shift and should be used whenever possible, particularly on low frequency work.

#### • [ac}

Ac coupling can be used to reject an unwanted dc component. This may allow a more sensitive input range to be selected.

## 5.3 SWEEP

SWEEP allows any one of the generator output parameters, *frequency*, *amplitude*, or *bias*, to be stepped through a range of settings, a new setting being used for each measurement.

# 5.3.1 [SWEEP]

Selection of sweep type, direction, and resolution.

#### 5.3.1.1 ENABLE

Sweep type:

### [off]

Sweep off.

#### • [lin. freq]

Linear frequency sweep. Successive frequencies differ by a constant frequency value ( $\Delta$  LIN).

## · [log. freq]

Logarithmic frequency sweep. Successive frequencies differ by a constant frequency ratio ( $\Delta$  LOG).

## • [amplitude]

Amplitude sweep. Successive amplitudes differ by a constant value (Δ LIN).

#### [bias]

Bias sweep. Successive bias levels differ by a constant value ( $\Delta$  LIN).

### 5.3.1.2 UP/DOWN

Sweep direction:

#### • [up]

Sweep from minimum limit to maximum limit.

#### • [down]

Sweep from maximum limit to minimum limit.

## 5.3.1.3 DLOG

Numeric entry which defines the number of measurement points for a [log. freq] sweep.

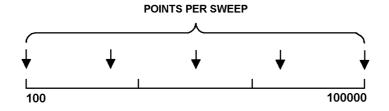

Fig 5.6 - Example of logarithmic frequency sweep: A LOG = 5 points per sweep (= 4 steps/sweep)

5-12 12600012\_Gmacd/CB

## 5.3.1.4 DLIN

Numeric entry which defines, for a [lin freq] sweep.

## • [pts/swp]

The number of points per sweep.

## • [unit/st]

The number of units per step. The "units" are Hz on frequency sweeps and volts or amps on amplitude or bias sweeps. (The step value need not be a sub-multiple of the sweep span.)

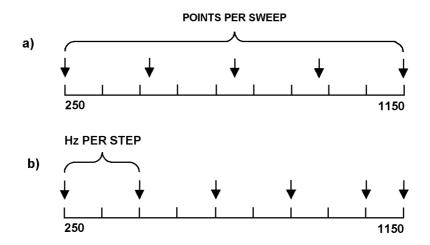

Figure 5.7 - Examples of linear frequency sweep:

a) D LIN = 5 points per sweep (= 4 steps/sweep);

b) D LIN = 200Hz per step.

# 5.3.2 [SWEEP LIMITS]

Selection of sweep limits for frequency, amplitude and bias.

## 5.3.2.1 FREQ

Frequency limits:

# FMIN()

Minimum frequency, in the range  $10\mu Hz$  to 32MHz.

#### F MAX (

Maximum frequency, in the range  $10\mu Hz$  to 32MHz.

## 5.3.2.2 V. AMPL

Voltage amplitude limits:

# V MIN()

Minimum amplitude, in the range: 0V to 3V ( $f \le 10 \text{MHz}$ ) 0V to 1V (f > 10 MHz)

#### V MAX()

Minimum amplitude, in the range: 0V to 3V ( $f \le 10 \text{MHz}$ ) 0V to 1V (f > 10 MHz)

# 5.3.2.3 V. BIAS

Voltage bias limits:

## V MIN()

Minimum bias, in the range - 40.95V to +40.95V.

#### V MAX()

Maximum bias, in the range - 40.95V to +40.95V.

## 5.3.2.4 I. AMPL

Current amplitude limits:

# I MIN ()

Minimum amplitude, in the range:

0mA to 60mA ( $f \le 10MHz$ ); 0mA to 20mA (f > 10MHz).

## IMAX()

Maximum amplitude, in the range:

0mA to 60mA (fS 10MHz); 0mA to 20mA (f> 10MHz).

## 5.3.2.5 I. BIAS

Current bias limits:

## I MIN ()

Minimum bias, in the range -100mA to + 100mA.

## IMAX()

Maximum bias, in the range -100mA to + 100mA.

**5-14** 12600012\_Gmacd/CB

# 5.4 DISPLAY

DISPLAY acts on the basic measurement data, obtained either from the analyzer or from the history file. These data are the amplitudes of the signals present at the V1, V2, and I inputs of the analyzer, and their phase relations. Various combinations of the data can be selected and the measurement results derived from them can be output in different forms. The history file can be accessed repeatedly to view the same data in many different ways.

## 5.4.1 DISPLAY

Selection of measurement results to be displayed and/or passed to the output ports. The display format is shown in Figure 5.8.

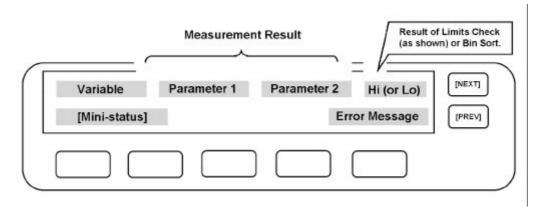

Fig 5.8 - Display format for measurement results

## 5.4.1.1 VARIABLE

The generator output parameter to be displayed as the variable:

- [freq]
  - Generator output frequency.
- [ampl]

Amplitude (rms) of ac component of generator output.

• [bias]

Level (dc) of generator output.

## 5.4.1.2 RESULT

To display a specific result a choice of measurement *source* is offered first. Then, depending on the source entered, a choice of *coordinates* is offered. The full range of sources and coordinates is shown in Table 5.1.

SOURCE		→COORDS→										
[Z1=VI/I]	Z,θ				[L(orC),R]	L(orC),Q	L(orC),D	R,X				
Y1=I/V1	Υ,θ				[L(orC),R]	L(orC),Q	L(orC),D	G,B				
Z2=V2/I	Z,θ				[L(orC),R]	L(orC),Q	L(orC),D	R,X				
Y2=I/V2	Y,θ				[L(orC),R]	L(orC),Q	L(orC),D	G,B				
FUNCTION ()	[r,θ]	$r(dB),\theta$	r,t*	r(dB),t*	L(orC),R	L(orC),Q	L(orC),D	a,b				
V1	r,θ	$[r(dB), \theta]$	r,t	r(dB),t				a,b				
V2	r,θ	$[r(dB), \theta]$	r,t	r(dB),t				a,b				
V1/V2	r,θ	$[r(dB), \theta]$	r,t	r(dB),t				a,b				
V2/V1	r,θ	$[r(dB), \theta]$	r,t	r(dB),t				a,b				
I	[r,θ]							a,b				

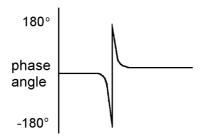

Table 5.1 - Measurement Source and Displayed Coordinates

## 5.4.1.3 PHASE

Phase presentation:

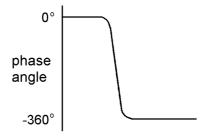

# • [normal]

Phase presented as an angle between  $+ 180^{\circ}$  and  $\sim 180^{\circ}$ . Angles  $> \pm 180^{\circ}$  are wrapped to obtain an equivalent relative angle. A plot of wrapped phase results relating to a system at resonance could appear thus:

## • [unwrapped]

Phase presented as an absolute angle between  $0^{\circ}$  and  $\pm$   $n^{\circ}$ . A plot of unwrapped phase results from the same basic data as the normal plot above would appear thus:

**5-16** 12600012\_Gmacd/CB

<sup>\*</sup>For time scale measurements use the analyser 'group delay' mode. (See Section 2.1.4.)

#### 5.4.1.4 CIRCUIT

The form of the circuit being measured, defined for SOURCE set to Z1, Y1, Z2, or Y2:

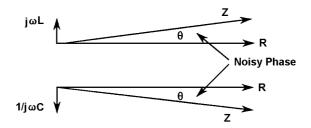

## • [parallel C,R]

Capacitor and resistor in parallel.

#### [auto]

With MODE in the ANALYSIS menu set to auto impedance the instrument automatically ascertains the form of the circuit being measured and displays component values for that form: a "p" or an "s" is displayed also, to indicate a parallel or series circuit. Use auto if the form of the circuit is not known.

Note that small phase components (resistors, for example) may give a confusing reading; noise can change a series R,L result to a series R,C result:

# [series L,R]

Inductor and resistor in series.

## • [series C,R]

Capacitor and resistor in series.

# • [parallel L,R]

Inductor and resistor in parallel.

#### 5.4.1.5 ALTERNATIVE CIRCUIT FORMS

The CIRCUIT setting can be used to find the equivalent component values of an alternative circuit form. Simply select the required form and read the component values from the display, using the L (or C) coordinates (see Section 5.4.1.2 above). For series to parallel, or parallel to series conversions the equivalent values are valid for the frequency of measurement only.

# 5.5 PLOTTER

Measurement results can be plotted on a suitable digital plotter. The PLOTTER menu gives a choice of graphics language, plot size and trace, and on/off control of text, grid and axes.

# 5.5.1 [PLOTTER]

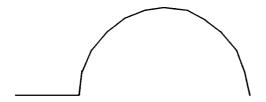

Trace, text, grid, axes, and graphics language selection.

## 5.5.1.1 MODE

Type of trace:

## • [vector]

Adjacent measurement results connected by a straight line, e.g.

## • [point]

Measurement results plotted as separate points, e.g.

# 5.5.1.2 TEXT

Plot annotation:

#### [on]

X and Y axes annotated with minimum and maximum values, items, units (if appropriate), title and time.

#### [off]

Results plotted without annotation.

# 5.5.1.3 GRID

Selects grid on or off; for divisions along the X and Y axes.

**5-18** 12600012\_Gmacd/CB

## 5.5.1.4 AXES

On/off control of text, grid and axes:

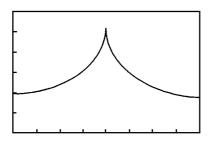

[off]

Results alone are plotted; no text, grid or axes.

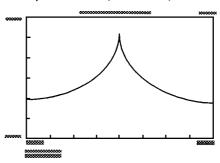

[on

Depending on the TEXT and GRID selections, plots may be made in the following styles:

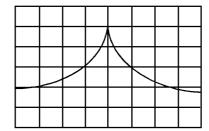

a) TEXT off, GRID off,

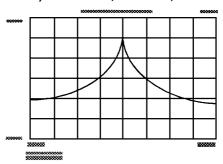

b) TEXT on, GRID off,

c) TEXT off, GRID on,

## d) TEXT on, GRID on,

# 5.5.1.5 **DEVICE**

Plotting device:

• [GPIB-HPGL]

Device using the Hewlett-Packard graphics language.

• [GPIB- ESGL]

Device using the Enertec Schlumberger graphics language.

# 5.5.2 [PLOTTER SCALING]

Choice of plot size:

## 5.5.2.1 SIZE

Standard size or scaled size.

• [A4] [A3]

Standard plot sizes.

[scaled]

Plot size, aspect ratio and position defined by X-MIN, Y-MIN, X-MAX, Y-MAX. See Section 11, for VERNIER method of setting up the scaled graph size.

## 5.5.2.2 X-MIN, Y-MIN, X-MAX, Y-MAX

Coordinates which define the plotting field, as shown in Fig 5.11. The coordinates can be set in the range 0 to 32000 units. One unit = 0.025mm, measured from the reference origin.

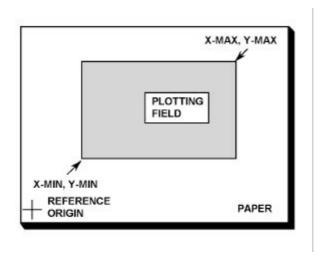

Figure 5.9 - Coordinates of the plotting field

# 5.5.3 [PLOTTER TITLE]

A user-defined title containing up to twenty five characters, alpha and numeric, can be entered. This title appears at the top of the plotting field.

**OLD** Displays the present title, e.g.

This title can now be edited, if required. This is done by overwriting the original characters. (There is no character insertion facility.)

**NEW** Displays a blank title space, for the entry of a new title.

**5-20** 12600012\_Gmacd/CB

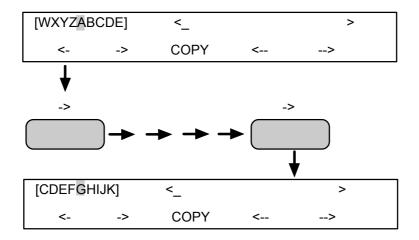

## 5.5.3.1 TITLE ENTRY

Characters are copied from the group in square brackets in the top left hand corner of the display. For each character to be copied the procedure is:

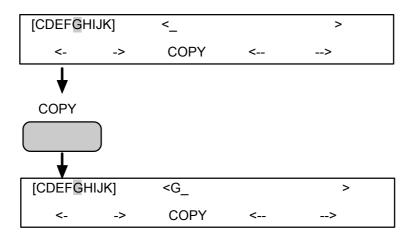

1. Select the group in which the character appears. Four different groups can be selected with NEXT or PREV:

[ WXYABCDE ] upper case alpha characters,
[ SPACE ] a space character,
[ ], .:1 2 3 4 5 ] numeric and miscellaneous characters,
[w x y z a b c d e] lower case alpha characters.

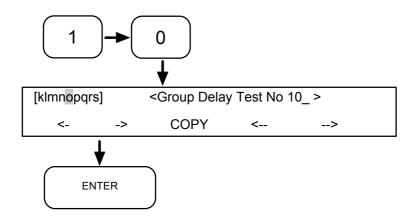

2. Select the character for copying by aligning it with the flashing cursor. To do this, move the selected group to the left or right by pressing the appropriate arrow key (on the left-hand side), e.g.

3. Copy selected character into title:

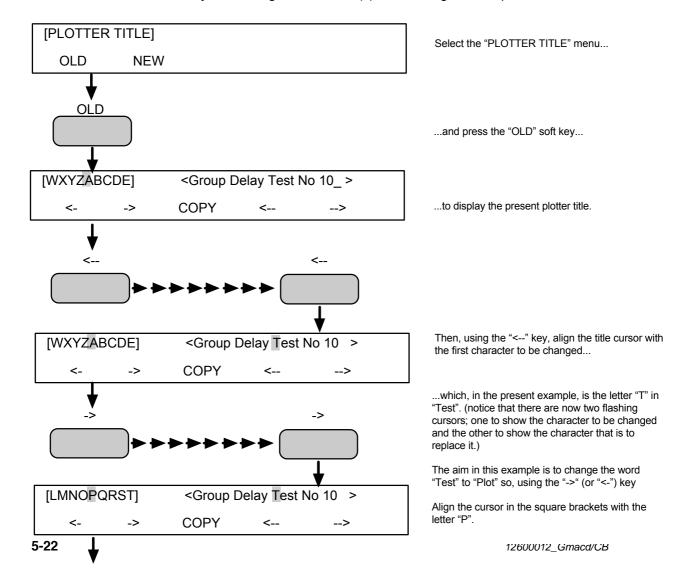

4. Repeat steps 1 to 3 until complete title is copied, then ENTER it.

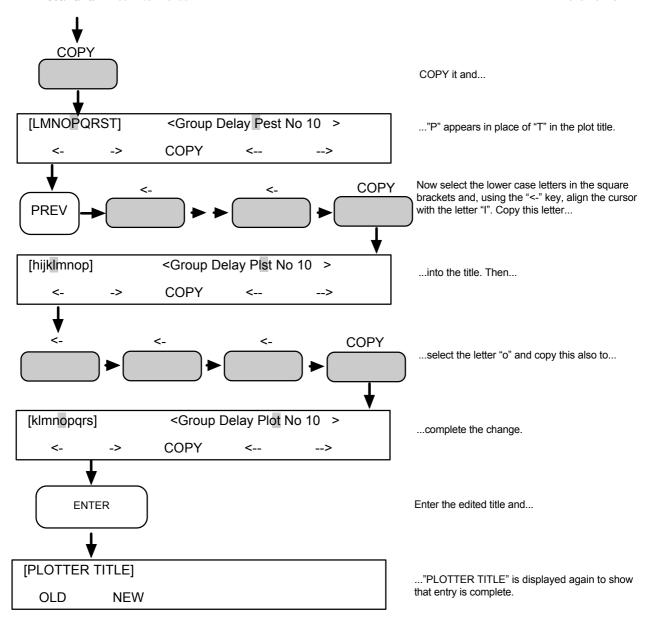

Note that numbers may be keyed in from the keypad. Spaces may be created in a blank title space simply by moving the cursor with the right-hand "-->" key.

## **5.5.3.2 TITLE EDIT**

The title is edited by overwriting the character(s) to be changed. The procedure is:

# **5.6 PLOT**

Direct action. Outputs data in the history file to the GPIB plotter. The data source and co-ordinates are selected from the DISPLAY menu and scaling values may be selected from SCALE/LIMITS.

The same data can be plotted in many different ways by varying the PLOTTER AXES settings.

## 5.7 PLOTTER AXES

The displayed *variable* and the two result parameters, *par 1* and *par 2*, can be assigned individually to any of the plotter axes. The relationship between displayed and plotted results for the default plotter axes settings is shown in Figure 5.10.

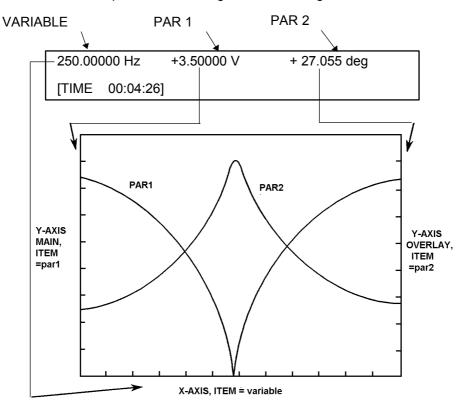

Figure 5.10 - Relationship between displayed and plotted results (default ITEM settings)

# 5.7.1 [PLOTTER X-AXIS]

X-axis definition, with the control parameters item, limits, lin/log, and pen.

# 5.7.1.1 ITEM

The item to be plotted along the X-axis. Selectable from variable, par 1, and par 2.

## 5.7.1.2 LIMITS

The minimum and maximum values of the X-axis. These values can be set automatically or manually, as required.

## • [auto]

Maximum and minimum values of the X-axis are set automatically, in accordance with the minimum and maximum values measured in a sweep. This gives the best plot resolution. (There is a brief delay, during which the plot limits are calculated, before the plot starts.)

# [manual]

Maximum and minimum values of the X-axis are set manually.

**5-24** 12600012\_Gmacd/CB

#### 5.7.1.2.1 MINIMUM and MAXIMUM

These two settings define the full-scale range of an X-coordinate, when LIMITS is set to *manual*. A similar pair of values is defined for the Y-axes and the overall effect is as shown in Figure 5.11.

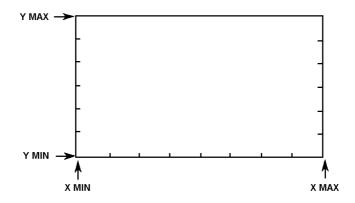

Figure 5.11 - Minimum and maximum values of the plot scale

## 5.7.1.3 LIN/LOG

Scaling of plotter X-axis.

### [auto]

Plotter X-axis scaling set automatially. Log scaling is selected for *log f sweeps*, whilst linear scaling is selected for all other sweeps (including amplitude and bias sweeps).

## [linear]

Linear X-axis scaling.

## [log]

Logarithmic X-axis scaling. (Note that the limit values must be >0 for log limits to be allowed.)

#### 5.7.1.4 PEN

Pen selection, for multi-pen plotters. A pen number is entered.

# 5.7.2 [PLOTTER Y-AXIS MAIN]

Same parameters as for X-axis, but applicable to the Y axis.

# 5.7.3 [PLOTTER Y-AXIS OVERLAY]

Same parameters as for X-axis, except for ITEM and LIMITS, but applicable to the Y overlay axis.

ITEM in the Y-axis overlay menu has an *off* setting. This is selected when the overlay plot is not wanted.

LIMITS in the Y-axis overlay menu has a *same as main* setting. This gives the same limits as for the Y-axis.

## 5.7.4 PLOT TYPES

The ability to assign any display item to any plot axis allows a wide variety of plot types to be set up.

A Bode plot, for example, is obtained with the settings

DISPLAY [COORDINATES]: [r(dB), θ]

➤ PLOTTER X-AXIS: [variable]

➤ PLOTTER Y-AXIS: [par 1]

This gives a Bode plot of amplitude r(dB) against frequency. If ITEM is set to [par 2] in the plotter Y-axis overlay menu an overlaid plot of phase angle  $\theta$  against frequency is obtained also.

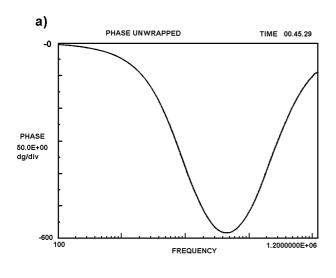

For the same data, a Nyquist plot can be obtained with the settings

➤ DISPLAY [COORDINATES]: [a,b]

➤ PLOTTER X-AXIS: [par 1]

➤ PLOTTER Y-AXIS: [par 2]

Examples of typical Bode and Nyquist plots are shown in Figure 5.12.

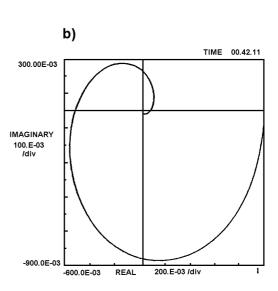

Figure 5.12 - Plot examples: a) Bode plot, b) Nyquist plot

**5-26** 12600012\_Gmacd/CB

# 5.8 DATA OUTPUT

**DATA OUTPUT selects:** 

- > the data output ports,
- > the data to be output, and
- > the data format.

# 5.8.1 [DATA OUTPUT]

As well as being displayed, the measurement results may be output through any combination of the RS423 port, the GPIB port, and the history file.

The data output facilities are listed in Table 5.2. Each output stream may not only be switched *on* or *off*, but can be restricted to data of interest with the *pass* or *fail settings*. *The dump* modes provide compressed data for computers and similar equipment. A [plotter] setting for the GPIB allows data to be output to a plotter as measurements occur.

Table 5.2 Data Output Facilities

Settin RS-423	igs Ava GPIB	ilable: FILE	Facility
D	D	>	[off] No data output.
>	>	D	[all] All data are output, but, with LIMITS on, any off-limit data are indicated by 'Hi' and 'Lo'.
>	>	>	[fail] Output restricted to fail data. No data are output if LIMITS is off.
>	>	>	[pass] Output restricted to pass data if LIMITS is on. All data output if LIMITS is off.
>	>		[dump] The measurement source data are output in a compressed form, suitable for storage or for computer processing.
>	>		[dump all] The analysis data from all input channels, and all variables, frequency, amplitude, and bias, are output in compressed form.
	>		[plotter] Data are output to the GPIB plotter, as measurements occur. (The plotter limits for this facility <i>must</i> be entered manually, otherwise it will not work.)

D = default setting;  $\triangleright$  = setting available

## **5.8.1.1 HEADING**

Headings can be included in the data that are output to RS423 and the GPIB.

Headings are intended for use with printers and VDUs, when data are presented in tabular form. A heading is assigned to each column to indicate the data type, units, etc.

#### [off]

No headings are output.

#### • [on]

Headings are output to:

- a) the RS423 port, if MODE is set for [printer].
- b) the GPIB port, if Talk Only is selected.

Headings are output when:

- a) HEADING [on] is entered, regardless of whether [on] was selected previously or not,
- b) a change is made to any control parameter which invalidates existing headings.

# 5.8.2 [GPIB CONFIGURE]

GPIB parameters. (The device address, Talk Only, and the input command terminator are set on a rear panel switch. PAR POLL, P SENSE, and SER POLL are set by remote command only.)

#### 5.8.2.1 TERM

Output terminator. The character, or characters, with which each measurement result is terminated:

## • [cr If]

Carriage return and line feed.

### • [cr If + EOI]

Carriage return, line feed and the signal EOI (end or identify).

#### [cr]

Carriage return.

## • [cr + EOI]

Carriage return and EOI.

## 5.8.2.2 SEP.

Output separator. The character with which output data fields are separated:

## • [commal

Comma separator.

## [terminator]

Separator same as terminator.

**5-28** 12600012\_Gmacd/CB

# **5.8.3** [RS423 CONFIGURE]

RS423 parameters. Note that the RS423 port is intended mainly for data output to a printer, VDU, etc. Use it for *limited* remote control of the instrument *only if you are fully conversant with RS423 protocol.* 

## 5.8.3.1 MODE

Choice of output data format, for controller or printer:

### [printer]

Spaced field format, suitable for printers having a minimum of 80 characters per line.

#### [controller]

Condensed format, suitable for a controller.

## 5.8.3.2 ECHO

Echoes back to an external device each character received from it. Typically used with keyboard type devices operating from RS423 to obtain a copy of the data sent. Refer to the device handbook to see if an echo is needed or not.

- [on] echo applied.
- [off] echo disabled.

## 5.8.3.3 TERM.

Output terminator. The character, or characters, with which each measurement result is terminated:

## • [cr If]

Carriage return and line feed.

## [cr If + null]

Carriage return, line feed and four null characters.

#### [cr]

Carriage return.

### • [cr + null]

Carriage return and four null characters.

## 5.8.3.4 SEP.

Output separator. The character with which output data fields are separated:

#### • [comma]

Comma separator.

## [terminator]

Separator same as terminator.

## 5.8.3.5 XOFF/XON

Transmit off/transmit on software handshake facility.

#### • [enable]

handshake enabled; XOFF and XON used.

#### [disable]

handshake disabled; XOFF and XON not used.

This selection governs the use of the XON/XOFF code by the instrument, i.e. whether or not the instrument outputs the command to a device sending data to it.

The instrument will always respond to an XON/XOFF command from a controller.

# 5.8.4 [FILE CONFIGURE]

History file parameters.

## 5.8.4.1 FORMAT

Measurements to be filed. Specified according to measurement mode.

#### • [normal]

File set for *normal* measurements.

## • [group delay]

File set for group delay measurements.

The history file must be cleared before changing the format.

## 5.8.4.2 CLEAR

History file clear function, auto or manual.

#### [auto]

File cleared automatically, at start of every sweep.

### • [manual]

File cleared manually, from VIEW FILE menu.

## 5.8.4.3 STATS

The results from which statistics are to be derived:

## • [par 1]

Statistics computed from Parameter 1\*.

# [par 2]

Statistics computed from Parameter 2\*.

\*Displayed parameter, see Section 4, Display.

**5-30** 12600012\_Gmacd/CB

# 5.9 SCALE/LIMITS

Under SCALE/LIMITS five functions are available:

- Swept measurements may be normalized to separate the results of interest from background data.
- > Effect of stray capacitance and inductance on the measurement results may be compensated for with the *null* facility.
- ➤ Individual measurement results may have a user-defined scaling function applied to them. The scaling function, set from the scale/limits menu, is applied when FUNCTION is selected as the display SOURCE; see Section 4.1.2.
- ➤ A limits check may be applied, which compares each measurement result against user-defined limits. This facility and *normalize* may be used together, for a profiled limits check.
- > Electrical components may be sorted.

# 5.9.1 [SCALING]

On/off control of NORMALIZE and NULL, and selection of CONSTANTS and FUNCTION for measurement scaling.

## 5.9.1.1 NORM.\*

Normalize on/off/evaluate:

• [off]

Normalize not applied.

# • [on]

The measurement results are divided by normalize values, the normalize values having been previously evaluated.

### [evaluate]

First set up the sweep parameters and then enter [evaluate]. A sweep is actioned and the normalize values thus obtained are stored. On completion, [on] is selected automatically and the results from any further sweeps are divided by the normalize values.

Changing the sweep parameters after evaluate has been entered invalidates the normalize values. Commanding a sweep with normalize [on] then evokes the message, "29. RENORMALIZE", until [evaluate] is entered again.

Note that the maximum number of points/sweep selectable for normalize [on] or [evaluate] is 243 for the normal analyzer mode and 192 for group delay.

\* DATA O/P: FILE CONFIGURE CLEAR must be in [auto] mode when normalize [on] or [evaluate] is used.

#### 5.9.1.2 NULL\*

Null on/off/evaluate:

#### [off]

Null not applied.

#### [on]

Effect of stray inductance and capacitance on measurement results is removed in accordance with previously evaluated null values.

#### [evaluate]

Starts the null procedure, which is:

- 1. In accordance with the displayed message, insert a shorting bar.
- 2. Press the PAUSE/CONT key.
- 3. Wait for the message "Remove shorting bar." then do so.
- 4. Press the PAUSE/CONT key.

When nulling is complete NULL is set to [on] automatically.

Nulling may be used with either single-point -or sweep measurements. Set the input and sweep parameters before selecting [evaluate].

Whilst the null values are being evaluated some of the generator and analyzer control parameters are set temporarily to settings which may differ from those selected by the user. However, a return is made to the user-defined settings when null evaluation is complete.

\* DATA O/P: FILE CONFIGURE CLEAR must be in [auto] mode when null [on] or [evaluate] is used.

#### 5.9.1.3 CONSTS

Nine user-defined constants, for use with scaling facility.

#### • [a, b]

Scaling by Cartesian coordinates.

# • [r, θ]

Scaling by polar coordinates.

Scaling constants are numbered from 1 to 9 inclusive. This number is entered by the user when CONSTS is selected.

The entry of [a, b] or [r,  $\theta$ ] prompts the entry of user-defined coordinate values.

# 5.9.1.4 FUNCT

User-defined scaling function. Eighteen different functions may be entered, and are numbered by the user on entry. Functions 1 to 9 are stored in the battery sustained memory and functions 10 to 18 are stored in the non-volatile memory.

New functions are *learnt*. Previously entered functions no longer needed may be *cleared*.

The use of the scaling function is described in detail in Chapter 10, "Measurement Scaling".

**5-32** 12600012\_Gmacd/CB

**LEARN** displays a choice of variables and operators which the user may use to build up a scaling function. To ensure correct syntax, only valid choices are shown.

**CLEAR** deletes the specified function, ready for the entry of a new function under the same number.

# 5.9.1.5 DEV D

Computes the deviation of the present result from a stored result.

## • [off]

Deviation facility not selected.

#### [Δ]

You are invited to enter the number of a stored result. When this is done the display shows, for each measured result, the difference between the result and the stored value. An asterisk (\*) is displayed also, to show that the displayed value is not the measured result.

#### [∆%]

Same procedure as for [ $\Delta$ ]. With the [ $\Delta$ %] setting, however, the difference between stored and measured results is expressed as a percentage value.

# 5.9.2 [LIMITS]

Displayed parameter limits check.

**ITEM** Parameter to be checked:

#### • [par 1]

Parameter 1.

## • [par 2]

Parameter 2.

Parameter 1 and Parameter 2 are the coordinates of the displayed measurement result. (See Section 4.)

**LIMITS** The LOWER LIMIT and the UPPER LIMIT against which the selected parameter is to be checked.

# 5.9.3 [BINSORT A]

**Note:** The Binsort option is no longer available from Solartron. This section is retained for reference only.

The [BINSORT A] menu allows you to choose:

- > the sorting method, continuous, fixed count, or random,
- > the item to be sorted,
- > the number of the tolerance bands, or bins,
- > when to stop the sort.

Continued overleaf....

## 5.9.3.1 ENABLE

The sorting method. This may be chosen from:

#### [off]

No sorting done.

## • [continuous]

Every component sorted.

#### [fixed count]

Every nth component sorted. (n = STEP SIZE.)

#### [random]

Random sort, within a maximum step size.

## 5.9.3.2 ITEM

The display parameter sorted.

#### • [par1]

Parameter 1 sorted.

## • [par2]

Parameter 2 sorted.

On entry of the display parameter setting you are invited to enter the *parameter value*. This is the nominal value to which the tolerance values, specified under BINS, refer.

## 5.9.3.3 BINS

First you specify the number of bins into which the components are to be sorted. Then, for each bin, you define the MIN% and MAX% tolerance values, each of which refers to the parameter value entered under ITEM. A physical set of component bins may be used to store the components as their corresponding bin number is displayed.

## 5.9.3.4 STOP

Defined conditions for stopping test.

#### [off]

Test stopped only when ENABLE [off] is selected.

## • [on]

Measurements stopped after a number of tests have been made. This number is defined by the user.

## 5.9.4 [BINSORT B]

**Note:** The Binsort option is no longer available from Solartron. This section is retained for reference only.

The [BINSORT B] menu allows you to choose the parameters for operating a component test machine. These are:

- > the number of attempts to be made to get a "pass" result.
- > the machine drive levels.
- > the machine drive logic.

**5-34** 12600012\_Gmacd/CB

#### 5.9.4.1 RETRY

Enter the maximum number of times each component is to be measured in an attempt to obtain a pass result.

#### 5.9.4.2 LEVELS

The voltage levels required to drive the component test machine.

### • [+5V]

Drive levels are +5V and 0V.

#### [+18V]

Drive levels are +18V and 0V.

## 5.9.4.3 LOGIC

The logic sense required to drive the component test machine.

## • [negative]

Negative logic, i.e. 0V = '1' and +5V (or +18V) = '0'.

#### [positive]

Positive logic, i.e. 0V = '0' and +5V (or +18V) = '1'.

## 5.9.5 BINSORT FUNCTIONS

**Note:** The Binsort option is no longer available from Solartron. This section is retained for reference only.

To perform the functions defined under BINSORT A and BINSORT B the instrument must be fitted with the binsort option card. The following hierarchy of binsort functions is then available:

#### **SWEEP**

With a sweep enabled, each component tested is subjected to a sweep and the bin selected is related to the worst case result. In this mode a SINGLE command results in a single sweep and a RECYCLE command results in repeated sweeps. This function encompasses the LIMIT and NORMAL functions described below.

## LIMIT

A limit check can be selected for one display parameter whilst the other parameter is used for sorting. A fail result from the limits check fails the component, regardless of the binsort result. The LIMIT function encompasses the NORMAL function described below.

#### NORMAL

A binsort check is applied to each measurement result, for a selected number of "bins" (32 max.). Each bin corresponds to a specified tolerance band.

The value of the displayed parameter to be sorted is compared with the bin limits (which define the tolerance bands) and the number of the bin whose tolerance fits the sorted parameter is displayed. Also, an appropriate bin select line is asserted: this may be used to energise the appropriate trap on a mechanical binsorter or, with manual sorting, to illuminate a lamp on the appropriate acceptor bin.

If the value of the sorted parameter is outside all specified tolerance bands then "99" is displayed to signify that the component has failed. The identity of the bin select line asserted is one greater than that of the number of bins. This line may be used to energise the fail trap on a mechanical sorter or, with manual sorting, to illuminate the fail bin.

#### 5.9.5.1 BINSORT CONNECTIONS

The way to connect the instrument to a mechanical binsorter will be described in the binsorter manual.

Nulling with a binsorter should be done at the component test contacts.

### 5.9.5.2 EFFECT OF "BREAK" COMMAND

If "break" is commanded during a binsort the instrument remembers the point at which it was stopped and restarts from that point. The "stop on" value\* which is displayed on sort completion includes the number of tests made before break was commanded.

\*Number of components tested, see Section 9.3.4.

## 5.9.6 PROGRAM KEYSWITCH

The setting of the PROGRAM keyswitch on the rear panel determines the use of the non-volatile memory for scaling functions (see Section 9.1.4). Two switch positions are used:

a) SUPERVISOR A scaling function may be stored in, or recalled from, any

location, from 1 through 18. All locations may be cleared. In SUPERVISOR mode the instrument takes several seconds to

initialize.

b) NORMAL A scaling function may be recalled from any location, but may

be stored only in locations 1 through 9. Only locations 1

through 9 may be cleared.

c) OPERATOR Reserved for future use.

To set the instrument into the supervisor or normal mode, turn the key to the appropriate position and command "BREAK".

To protect the contents of the non-volatile memory, operate the instrument in the normal mode whenever possible.

**5-36** 12600012\_Gmacd/CB

# 5.10 VIEW FILE

VIEW FILE acts on the basic measurement data stored in the history file. The form of the output results is selected from the DISPLAY menu (see Section 4).

# 5.10.1 [VIEW FILE]

**DISPLAY** Displays file location #1. Use the [DISPLAY FILE] menu to go to other file locations.

LIST On entry, each file location is output in quick succession. This facility is intended for sending filed data to an external device, via RS423 or the GPIB.

LIST may also be used for updating the statistics readings: see Section 12.2.4.

**CLEAR** Erases the file contents and displays '40. FILE CLEARED'.

# 5.10.2 [DISPLAY FILE]

When DISPLAY is selected, in the [VIEW FILE] menu, file location #1 is displayed. Other file locations are accessed as follows:

#### > BOF

Beginning of file. (Location 1)

#### EOF

End of file. (The highest numbered location containing a result)

#### > NEXT

Next location. (Location n + 1)

#### > PREV

Previous location. (Location n - 1)

#### > LINE

Location n.

## **5.10.3 FILE SIZE**

The number of results that the history file will hold depends on which analyzer mode is in use, *normal* or *group delay,* and on whether or not *null* or *normalise* is selected (from the SCALING menu). See Table 5.3.

Table 5.3 Size of History File

Null/Normalize	Storage Space Available						
	Normal	Group Delay					
Null off; normalize off Null on; normalize off Null off; normalize on	405 results 280 results 243 results	331 results 243 results 192 results					

# 5.11 VERNIER

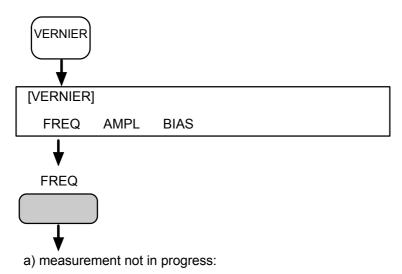

Use VERNIER to adjust the generator output, whether measurements are being made or not.

VERNIER can also be used to adjust the size of the plotting field, whilst watching the pen movement.

# 5.11.1 ADJUSTING GENERATOR PARAMETERS: FREQ, AMPL, OR BIAS

The generator parameter on which the vernier is to act is selected from the first menu page.

The selected parameter is displayed on entry, together with the vernier soft key functions. The format of the display depends on whether or not measurements are being made:

## b) measurement in progress:

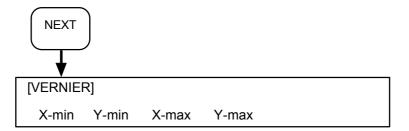

100.00000 Hz		3.514 dB	-37.01 dg	
<	>	UP	DOWN	

In case b) the generator parameter selected from the [VERNIER] menu is automatically selected as the displayed *variable*. In both cases, the selected parameter is adjusted as described in Sections 11.3 and 11.4.

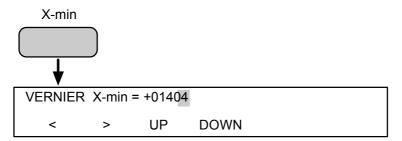

**5-38** 12600012\_Gmacd/CB

## 5.11.2 ADJUSTING PLOTTER SCALING

Plotter scaling can be adjusted with the second [VERNIER] menu, which is selected with the NEXT key. (For this facility to work, [plotter] must be selected for the data output to the GPIB; see Section 8.1, in the present chapter.)

Pressing a soft key, for X-min, Y-min, X-max, or Y-max, displays the previously entered value. This value can be adjusted with the arrow keys and up/down keys, whilst watching the pen movement. See Sections 11.3 and 11.4 below.

## 5.11.3 VERNIER DECADE

The decade on which VERNIER is to act is indicated by a flashing cursor. Set the cursor position with the arrow keys:

- < Moves cursor one place to the left.
- > Moves cursor one place to the right.

## **5.11.4 VERNIER ADJUSTMENT**

Adjust the selected parameter with the UP and DOWN keys:

UP Increments the parameter value by one digit.

DOWN Decrements the parameter value by one digit.

Sustained pressure on either key gives continuous parameter adjustment.

## 5.11.5 REMOTE CONTROL OF THE VERNIER

Vernier control of the generator parameters *frequency*, *amplitude* and *bias* is selected with the commands V0, V1 and V2. In reply to each of these commands the instrument outputs the present parameter value. The controller can then use the step vernier command SPF to increment or decrement the value accordingly.

Vernier control of the plotter scaling values X-MIN, Y-MIN, X-MAX and Y-MAX is selected with the commands V3, V4, V5 and V6. In reply to each of these commands the instrument outputs the present parameter value followed by three strings of instructions, coded in HPGL. The controller uses the HPGL instructions to relay the parameter value, modified as necessary, to the plotter.

**5-40** 12600012\_Gmacd/CB

## **5.12 STATUS**

The STATUS pages display control information not accessible under other control keys. Two leader pages [ STATUS 1 ] and [ STATUS 2 ] display the information sources; each source has available several pages of information. Pages are selected with NEXT and PREV. To return from an information page to a leader page, press ENTER.

# 5.12.1 [STATUS 1]

The Status 1 information appears under five headings:

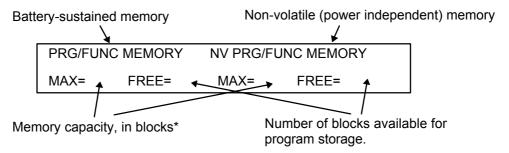

a) PROGRAM	Learnt program memory.
b) μP	Microprocessor mode.
c) INTFACE	GPIB and RS423 data ports.
d) STORE	Control set-up store.

e) FILE History file.

## 5.12.1.1 PROGRAM

Learnt program status. (Three pages)

Page 1: Capacity and Availabilty of Program Memory

FUNCTION 1	
V!^2	

# 5.12.2.2 CONST

Scaling constant stores in use, and constants stored. (Ten pages.)

C = constant entered.

Pages 2 to 10: Constants Stored in Battery-Sustained Memory

CONSTANT 1	а	b
	+1.35	-0.275

Constant stored

# **5.12.2.3 RESULTS**

Results stores in use, and results stored. (Ten pages.)

Page 1: Results Stored in Battery-Sustained Memory

5	6	7	8	9
			-	9

R = result stored

# Page 2: Stored Results

RESULT STORE 1	g. delay = 5.3479ns
a = 13.567	b = 1.259

#### 5.12.2.4 STATS

Statistics of measurements stored in history file. (Two pages)

MEAN	MINIMUM	MAXIMUM

COUNT	STANDARD DEV	VARIANCE

The results from which the statistics are to be derived are selected as *Par 1* or *Par 2*, from STATS in the FILE CONFIGURE menu. Par 1 and Par 2 are the displayed parameters, which, in turn, are selected from the DISPLAY menu.

The statistics computed are the minimum and maximum values, the result count, i.e. the sample size *n*, and

$$MEAN = \sum_{i=1}^{i=n} \frac{x^i}{n} = x_{mean}$$

$$VARIANCE = \sum_{i=1}^{i=n} \frac{(x_i - x_{mean})^2}{n}$$

STANDARD DEV = 
$$\sqrt{\left(\sum_{i=1}^{i=n} \frac{(x_i - x_{mean})^2}{n}\right)}$$

To ensure that the statistics are meaningful and accurate:

- 1. CLEAR the history file, from the VIEW FILE menu.
- 2. Make a series of measurements, ensuring they are stored in the history file.
- 3. Select the parameter from which the statistics are to be derived, from the DISPLAY and FILE CONFIGURE menus.
- 4. LIST the filed results, from the VIEW FILE menu.
- 5. Read the statistics from the STATS pages shown above.

To derive the statistics of other parameters from the same measurements, repeat steps 3 through 5.

5-46

# 5.13 STORE/RECALL

Control set-ups, and measurement results, can be stored in memory for later use.

# 5.13.1 [SET UP]

Sixteen locations are available for control set-ups.

Control set-up action:

**STORE** Stores the present settings of all control parameters, in any free location

from 1 through 16. (Stores 10 and 16 are in non-volatile (NV) memory.)

**RECALL** Sets the control parameters in accordance with the contents of the

specified store.

**CLEAR** Clears the specifed store.

# 5.13.2 [RESULT]

Nine locations are available for measurement results.

Result storage is all that needs to be commanded. The stored values are used by FUNCTION in the [SCALE/LIMITS] menu (see Chapter 10) and are recalled automatically when scaling by a stored value is specified.

STORE Stores the displayed result (derived from the last measurement or from

filed data) in any free location from 1 to 9.

## 5.13.3 PROGRAM KEYSWITCH

The setting of the PROGRAM keyswitch on the rear panel determines the use of non-volatile memory for control set-ups and measurement results. Two switch positions are used:

a) SUPERVISOR Control settings may be stored in, or recalled from, any location,

from 1 through 16. All locations may be cleared.

b) NORMAL Control settings may be recalled from any location, but may be

stored only in locations 1 through 9. Only locations 1 through 9

may be cleared.

c) OPERATOR Reserved for future use.

To set the instrument into the supervisor or normal mode, turn the key to the appropriate position and command "BREAK".

To protect the contents of the non-volatile memory, operate the instrument in the normal mode whenever possible.

# 5.14 LEARN PROGRAM

LEARN PROGRAM allows the instrument to be programmed with a series of commands. A maximum of eighteen separate programs can be stored, and each is started from EXECUTE PROGRAM. See program STATUS (Section 12.1) for memory availability.

# 5.14.1 LEARN

Sets the instrument to memorize the commands. First enter a program number. Then, each command entered is stored as a program instruction.

NV programs can not be learnt directly. Learn a program in the range 1 to 9 and then copy it to an NV program 10 to 18.

QUIT When program entry is complete press QUIT.

## 5.14.2 EDIT

Allows a learnt program to be modified. First enter the program number. The first program instruction is then displayed and the following functions become available:

**INSERT** Allows one or more instructions to be inserted between the displayed instruction and the instruction before it. Select the instruction you want displayed, with PREV or NEXT. To return to the edit level (as selected by the EDIT hard key) press the EDIT soft key.

**DELETE** Deletes the displayed instruction. Select displayed instruction with PREV or NEXT.

**NEXT** Selects and displays the next instruction.

**PREV** Selects and displays the previous instruction.

**QUIT** When editing is complete press QUIT.

To edit an NV program, copy it to program 1 to 9, edit it, clear the original NV program, and then copy the edited program back again.

#### 5.14.3 CLEAR

Deletes the instructions stored under a selected program number. The number is then available for a new program.

#### 5.14.4 COPY

Provides a complete copy of a selected program under another program number. Used with EDIT, this facility allows one program to be derived from another.

**5-48** 12600012\_Gmacd/CB

# 5.14.5 PROGRAM KEYSWITCH

The setting of the PROGRAM keyswitch on the rear panel determines the use of the non-volatile memory for learn programs. Two switch positions are used:

a) SUPERVISOR Learn programs may be stored in, or recalled from, any location,

from 1 through 18. All locations may be cleared.

b) NORMAL Learn programs may be recalled from any location, but may be

stored only in locations 1 through 9. Only locations 1 through 9

may be cleared.

c) OPERATOR Reserved for future use.

To set the instrument into the supervisor or normal mode, turn the key to the appropriate position and command "BREAK".

To protect the contents of the non-volatile memory, operate the instrument in the normal mode whenever possible. In particular, do not switch the instrument on or off when the keyswitch is in 'Supervisor' mode

# 5.15 SELF TEST

Under SELF TEST, four functions are available:

## 5.15.1 TEST

Checks the operation of the measurement hardware, the microprocessor, the keyboard, and the display.

On entry, the microprocessor is tested first. Then a test is made on the display.

The first stage of the display test starts immediately, but user action is required to progress through the remaining stages. The test sequence is:

1. Press TEST. All display elements light, and horizontal lines scroll down the display.

2. Press ENTER. Vertical lines run through each character in turn. The display elements light in sequence.

3. Press ENTER. The character set is displayed.

4. Press ENTER. The keyboard test is offered. Press any control key to display the

command code associated with it. The number of keys tested in

this way is recorded and displayed.

5. Press ENTER. Test complete. A successful test displays a 'PASS' message and

the software issue.

If the test was unsuccessful, a test failure message will be displayed. Some errors may be corrected from the front panel, as described below:

PROG. MEMORY FAIL (?TS1 =1): Try initialising memory.

NV PROG. MEMORY FAIL (?TS1 = 2): Problem may be caused by turning power off with unit in "Supervisor" mode. Fault can be cleared by pressing "Initialise" with the unit in "Supervisor" mode.

SET-UP FAIL (?TS1 =1): Try initialising memory.

NVSETUP FAIL (?TS1 = 2): Problem may be caused by turning power off with unit in "Supervisor" mode. Fault can be cleared by pressing "Initialise" with the unit in "Supervisor" mode.

Once the remedial action has been taken, re-test the instrument using SELF-TEST-Test. If the fault persists, contact your Solartron Service Centre.

5-50 12600012\_Gmacd/CB

## 5.15.2 INIT

Sets the control parameters to the default state, clears the history file, the result/control stores and learn program memory, and displays 'INITIALIZED'.

**CAUTION:** The content of the non-volatile stores and program memory is cleared if the PROGRAM keyswitch is set to SUPERVISOR when INIT(ialize) is commanded. In this case initialise takes several seconds.

# 5.15.3 **RESET**

Sets the control parameters to the default state and displays 'RESET'. The data in user-accessible memory are left intact.

# 5.15.4 TIME

The internal clock stops whenever power is switched off and restarts from zero when power is restored, on *reset*, or *initialize*. Use TIME to set the clock. Enter HOURS first, then MINUTES.

## 5.15.5 ERROR-

Beep tone that draws attention to a displayed 'error' message.

**[on]** Beep tone sounds briefly when message is -displayed.

[off] Beep tone off.

**6-1** 12600012\_Gmacd/CB

**6-2** 12600012\_Gmacd/CB

# 6.1 INTRODUCTION

Connections to the item under test are made from BNC sockets on the instrument front panel. The GENERATOR output is connected to the input of the item under test, and three input channels, VOLTAGE 1, VOLTAGE 2, and CURRENT, are available for measuring the test response.

Connections can be made directly to the front panel connectors, using suitably terminated screened leads. Or, for impedance measurements, connections can be made via a test module which fits over the connectors.

# 6.2 ANALYZER VOLTAGE INPUT CONFIGURATIONS

A menu of input configurations, available under the ANALYZER hard key, allows the analyzer inputs to be configured independently for single-ended or differential measurements, with the outer (screen) of the input leads grounded or floating. The connections and input configurations for typical applications are shown in Sections 2.1 and 2.2.

# 6.2.1 SINGLE-ENDED VOLTAGE INPUTS

Single-ended inputs may be used where the signals to be measured are referred to a general ground, such as the main chassis of the item under test. A typical application is shown in Fig. 6.1. The connections shown will allow the combined performance of amplifiers A1 and A2 to be measured. Alternatively, INPUT V1 Hi could be connected to test point TP2 to measure amplifier A2 only, or INPUT V2 Hi could be connected to TP2 to measure amplifier A1 only.

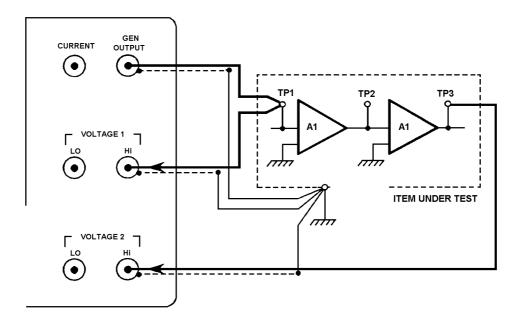

Figure 6.1 - Typical use of single-ended voltage inputs

The connections made at the analyzer input for single-ended inputs, floating or grounded screen, are shown in Figure 6.2. These connections are made within the instrument and are selected from the INPUT V1 and INPUT V2 menu pages.

A floating screen can accomodate a limited common mode signal from the item under test.

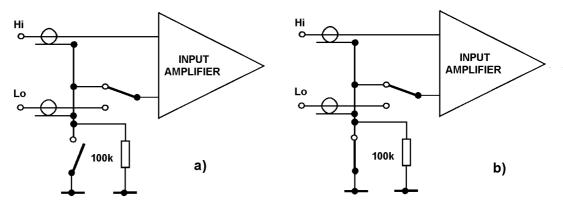

Figure 6.2 - Single-ended input configuration, with a) floating screen and b) grounded screen

## 6.2.2 DIFFERENTIAL VOLTAGE INPUTS

Differential inputs may be used where the signal to be measured has a reference point separate from the general ground. Such signals could appear:

- a) across an individual component or
- b) between a test point and signal ground, as in the example shown in Figure 6.3.

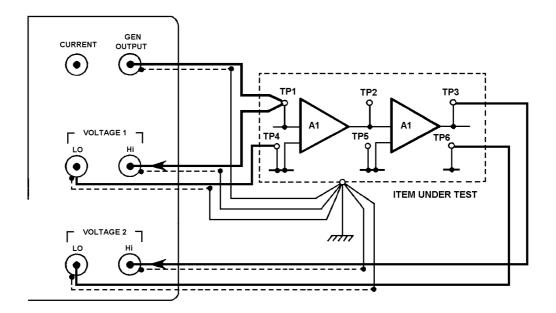

Figure 6.3 - Typical use of differential voltage inputs

The analyzer inputs will tolerate a common mode signal of up to 5V. In the above example this would appear between test points TP4, 5, and 6, and the general ground.

The generator output has a "floating" Lo (screen) which will tolerate 0.4V of ripple or dc potential from the general ground.

**6-4** 12600012\_Gmacd/CB

The connections made for differential inputs, floating or grounded screen, are shown in Figure 6.4.

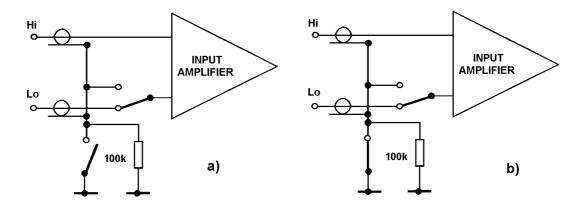

Figure 6.4 - Differential input configuration, with a) floating screen and b) grounded screen

# 6.3 HIGH FREQUENCY MEASUREMENTS

For drive frequencies in the region of 1MHz and above, care must be taken to match the input and output impedances of the instrument and item under test with the impedance of the connecting cables ( $50\Omega$ ). This is to avoid standing wave problems, which occur when the length of the connecting cables is about a quarter-wavelength of the drive signal frequency.

Inputs are matched to the cable with  $50\Omega$  feedthrough terminators. The generator output, when driving a pair of inputs, is connected through a 50 power splitter. A typical application of these devices is shown in Figure 6.5.

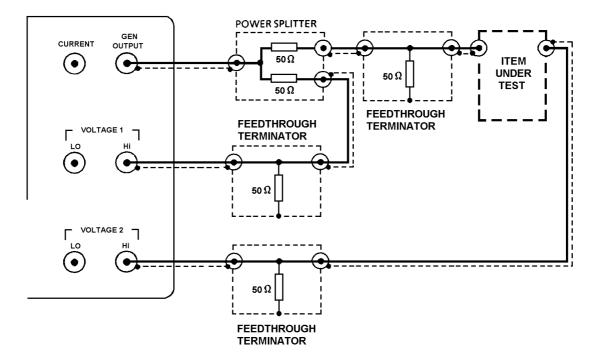

Figure 6.5 - Typical connections for high frequency voltage measurements

# 6.4 EQUIVALENT CIRCUITS

The equivalent circuits of the generator output and the analyzer inputs are given in Figures 6.6 and 6.7. These may be used when estimating loading effects on a) the item under test and b) the generator output.

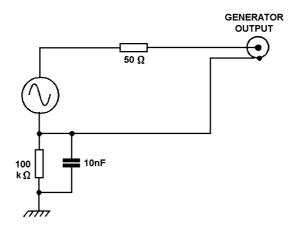

Figure 6.6 - Equivalent circuit of generator output

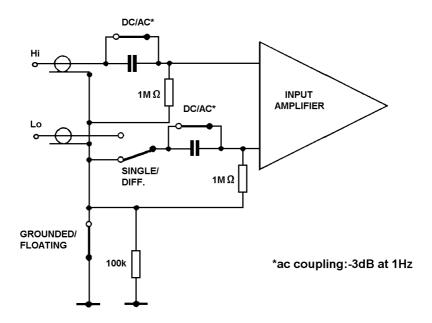

Figure 6.7 - Equivalent circuit of analyzer input

**6-6** 12600012\_Gmacd/CB

# 6.5 BASIC CONNECTIONS FOR IN-CIRCUIT IMPEDANCE MEASUREMENTS

The basic connections for in-circuit impedance measurements are shown in figure 6.8. This is intended as a guide when connections are made other than through a test module, e.g. in automatic test systems.

All circuit paths in parallel with the item under test, **which have an external node**, may be excluded from the measurement by virtual earth guarding. Simply connect each node to ground through the screens, as shown in figure 6.8.

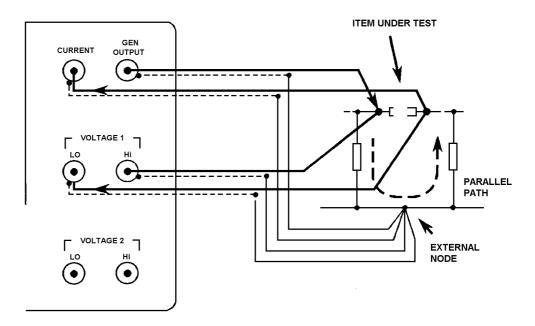

Figure 6.8 - Connections to be made for in-circuit impedance measurements when not using the in-circuit test module

For convenience two modules are available for impedance measurement. The 12603A is for in-circuit measurement, as shown in figure 6.8, while the 12601A is optimised for h.f. measurements on components. See section 6 for details.

# 6.5.1 CABLE LENGTHS

Accuracy may be degraded by long cable lengths. In particular, capacitance in the CURRENT and VOLTAGE 1 LO inputs will affect current measurement accuracy at h.f. so these cables should be kept as short as possible. Use the high current ranges (6mA or 60mA) above 1MHz as these are less affected.

Best h.f. impedance measurements are obtained using the 12601A Test Module which minimises connection strays.

# 6.6 THE TEST MODULES

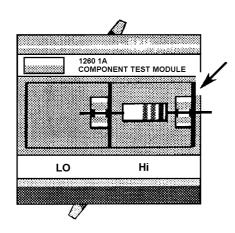

Two types of impedance test module are available: the 12601A module, for testing loose components, and the 12603A module, for measuring components in-circuit. Both types are available as options.

# 6.6.1 12601A COMPONENT TEST MODULE

The 12601A component test module makes it easy to connect loose components to the instrument front panel terminals.

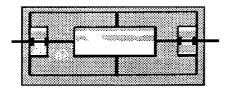

#### 6.6.1.1 COMPONENT CLAMPS

Two types of component clamps are supplied with the module

One type of clamp is suitable for components with axial leads. To insert the component under test, simply grasp the leads firmly at either end and push them into the clamps.

Note that the component clamps are labelled HI and LO. These labels refer to the Hi and Lo connectors of the Voltage 1 analyzer input. As shown in Section 6.1.3, the generator output is applied to the HI side of the item under test. When testing polarized components, make sure that you insert them the right way round. (Remember, the bias can be set either positive or negative.)

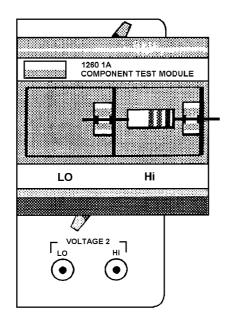

Axial lead component clamps can be inserted into the test module either way round. This allows connections to be made near to the lead entry points on both large and small components and minimizes errors due to lead impedance.

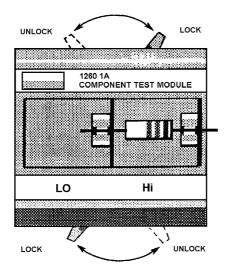

The other type of clamp may be fitted for components with radial leads.

**6-8** 12600012\_Gmacd/CB

## 6.6.1.2 FITTING AND REMOVING THE TEST MODULE

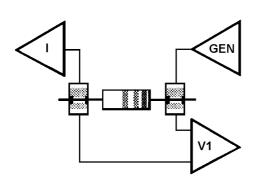

The test module fits onto the four upper BNC terminals on the instrument front panel and is locked onto these by a pair of lever-operated connectors.

**To fit the module**, set the levers to UNLOCK, push the module firmly onto the four upper connectors until resistance is met, and set the levers to LOCK.

**To remove the module**, set the two levers to the UNLOCK position and pull the module carefully away from the front panel connectors.

# 6.6.2.1 TEST MODULE CONNECTIONS

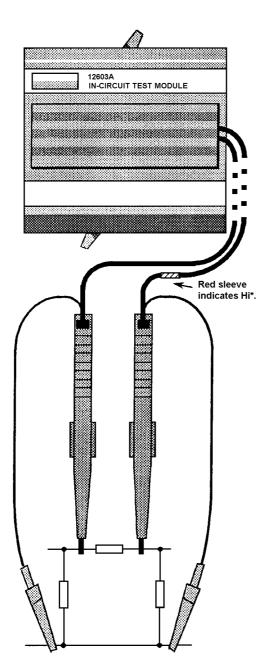

The GEN OUTPUT drives a current through the component under test, into the CURRENT input. A voltage is thus developed across the component and is applied across the Hi and Lo terminals of the VOLTAGE 1 input. Ratios of the current and voltage values measured yield the impedance values.

*1.* **6-9** 

## 6.6.3 12603A IN CIRCUIT TEST MODULE

The 12603A test module allows components to be measured in-circuit. The effect of parallel component networks may be eliminated by using *virtual earth* guarding. The 12603A is not recommended for use above 1MHz.

A pair of component clamps on flying leads are fitted on either side of the component to be measured.

Both guard clips are connected to the 'nodes' surrounding the points of measurement. This largely eliminates the effect of parallel networks from the measurement result.

The effect of guarding is, however, frequency dependent. Errors can occur towards the high end of the frequency range, particularly with capacitive parallel networks. The remedy is to reduce the measurement frequency until consistent results are obtained.

Stray impedances that appear across the component to be measured may be nulled. See Chapter 5, Section 5.9.1.2.

\*See Section 2.1.1, regarding the testing of polarized components.

**6-10** 12600012\_Gmacd/CB

<sup>\*</sup>See section 5.2.1.1, regarding the testing of polarized components.

**7-2** 12600012\_Gmacd/CB

# 7.1 INTRODUCTION

The instrument is fitted, as standard, with a GPIB interface and an RS423 interface, for communication with remote devices.

Full control and data input/output is possible through the GPIB.

RS423 is intended mainly for data output to a printer, VDU, etc, but, if the user is fully conversant with RS423 protocol, limited control of the instrument may, in some cases, be possible.

# 7.2 GPIB INTERFACE

The GPIB Interface conforms to the IEEE 488,1978 standard. The complete standard is published by the IEEE under the title: "IEEE Standard Digital Interface for Programmable Instrumentation". A useful introduction to the theory of the GPIB is given in the Solartron monograph: "Plus Bus - the Solartron GP-IB".

# 7.2.1 GPIB CAPABILITY CODE

The GPIB Interface in the instrument conforms to the following sub-functions within the standard, as listed on the rear panel:

SH1	Source handshake.
AH1	Acceptor handshake.
T5	Basic talker,. serial poll, talk only selectable, unaddressed if MLA ('My Listener Address).
TE0	No extended talker capability
L4	Basic listener, no listen only mode, unaddressed if MTA (My Talker Address).
LE0	No extended listener capability.
SR1	Complete service request capability.
RL1	Complete remote/local capability, with local lock-out.
PP2	Parallel poll with local configuration.
DC1	Complete device clear capability, including selective device clear.

C0 No controller capability.
DT0 No device trigger capability.
E1 Open collector drivers:

# 7.2.2 GPIB CONNECTOR

Connection to the GPIB is made via the 24-way connector on the IEEE 488/GPIB interface. See Fig. 7.1. The pin connections conform to the IEEE 488, 1978 standard.

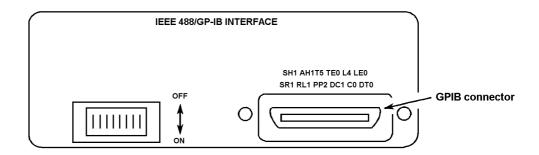

Figure 7.1 - GPIB interface

## 7.2.3 GPIB SWITCHES

Some interface functions are set by miniature toggle switches on the rear panel of the instrument. These functions are described below. (The remaining interface functions are set from the [GPIB CONFIGURE] menu.)

The GPIB switches are shown in Fig 7.2. These switches must be set before the instrument can be used in a GPIB system.

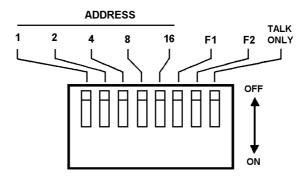

Figure 7.2 - GPIB switches. (All switches shown in off position.)

Once the switches have been set the instrument must read them, so that their settings can be implemented. The switches are read automatically at power-on, or on INITIALIZE, RESET, or BREAK. Power-on and BREAK leave other control settings unchanged, whilst INITIALIZE and RESET return them to the default state.

The GPIB switch functions are described in Sections 7.2.3.1 to 7.2.3.4 below.

#### 7.2.3.1 Device Address

The ADDRESS switches select the GPIB address of the instrument. To avoid problems associated with mixing binary and ASCII information two GPIB ports are provided. One port is used for for ASCII commands and data and the other for high speed binary *dump* output. The two ports are serviced through the same GPIB connector, but each has its own software address.

The address of the ASCII input/output port is the *major* address. This address must always be an even number, so always set the left-hand '1' switch to the *off* position. The odd-numbered address immediately following a major address is the *minor* address and is assigned automatically to the binary port.

## 7.2.3.2 Input Command Terminator

Use switches F1 and F2 to select the terminator that the instrument is to recognise for GPIB commands:

F1	F2	Terminator Selected
off	off	If (line feed)
on	off	cr (carriage return)
off	on	; (semicolon)
on	on	EOI (End or Identify signal)

**7-4** 12600012\_Gmacd/CB

EOI is one of the five GPIB management lines. Some controllers automatically assert EOI accompanied by a command terminator. In this case, select "EOI" with switches F1 and F2. If the controller itself offers a choice of command terminator, choose *carriage return*, *line feed*, or *semicolon*: this prevents command data being lost or corrupted.

Any command terminator other than the one selected is ignored by the instrument.

The command terminator selected should agree with that used by the GPIB controller. Details of the command terminator should appear in the controller handbook

# 7.2.3.3 Talk Only

Choose between talk only and talker/listener operation with the TALK ONLY switch:

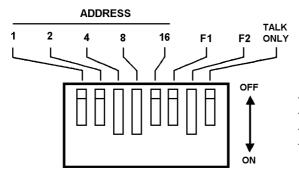

Talk only ON. The instrument can act as a *talker* only, to drive a *listen-only* device, such as a plotter, without the aid of a GPIB controller.

Talk only OFF. The instrument can act as either a *listener* or a *talker*, as commanded by the GPIB controller.

# 7.2.3.4 Example of GPIB Switch Settings

The *major* address is 12.
The *minor* address is therefore 13.
The command terminator is a semicolon.
The GPIB mode is talker/listener.

## 7.2.4 OUTPUT TO THE GPIB

The output of measurement results to the GPIB is controlled by the [DATA OUTPUT] GPIB setting (Chapter 5, Section 8.1). *All, fail,* and *pass* results are output in ASCII, and *dump* results in binary. The ASCII output can be selected for either a *talk only* device, such as a printer, or a *talker-listener* device, such as a GPIB controller. Binary data can be interpreted only by a controller, but can be stored, on disk for example, for subsequent controller processing.

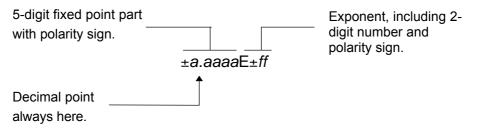

# 7.2.4.1 ASCII Output to a Talk Only Device

When the instrument is set for talk only operation (TALK ONLY switch set to ON) the format of ASCII data output to the GPIB is the same as for data output to an RS423 printer. (See Section 7.3.6.1 below.) This format is suitable for GPIB *listen only* devices such as printers or VDUs.

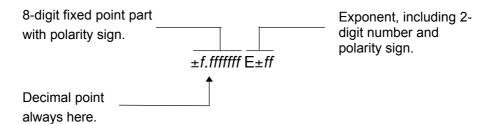

Column headings are selected *on* or *off* from [FORMAT] HEADING, as for RS423 devices. The same setting applies to both RS423 and GPIB devices.

# 7.2.4.2 Normal ASCII Output (for Talker-Listener Devices)

When the instrument is set for talker-listener operation (TALK ONLY switch set to OFF) data are output to the GPIB in a compressed form, suitable for interpretation by a GPIB controller. Each parameter, *except frequency*, is represented by an eleven character field, containing a five-digit fixed point part and a two-digit exponent:

Frequency is represented by a fourteen character field, containing an eight digit fixed point part:

A complete reading takes the form:

Variable Parameter 1 Parameter 2 Error Code Limits Code cr

The error code is represented by a single digit; only the last digit of a Group 8 error code is reported. The output separator is shown as a comma, and the output terminator is carriage return. The limits code represents a limits check: 00 = pass; -1 = Lo; +1 = Hi.

The output separator and terminator are selected from the [GPIB CONFIGURE] menu.

No headings are available and the last result is not re-output after menu changes. Use the 'DO' remote command to read the last result again, e.g. after changing the DISPLAY SOURCE.

# 7.2.4.3 GPIB Dump Output

Dump output gives the fastest output data rate. Each parameter is represented by a 32-bit floating point number whose format conforms to the ANSI/IEEE Standard 754 (see Section 7.4.3).

**7-6** 12600012\_Gmacd/CB

The full precision of the frequency setting cannot be represented in the 4-byte version of the IEEE 754 format. So, if full precision is required, a separate FR? command should be sent. The frequency can then be read in ASCII format.

No separators or terminators are used, as they cannot be distinguished from binary data. However, if the output terminator selected from [GPIB CONFIGURE] is either cr + EOI or cr, If + EOI, then the GPIB signal EOI (End or Identify) is asserted with the last byte.

The output rate is the same as that of the ASCII port, approximately 1 byte per millisecond, but the data is compressed. Also, the instrument's internal computation time is much less.

No headings are available and the last result is not re-output after menu changes. Use the 'DO' remote command to read the last result again, e.g. after changing the DISPLAY SOURCE.

## 7.2.5 SERIAL POLL

The instrument can be configured to request service from a GPIB controller when a particular event has occurred, e.g. on *end of sweep*, or *data ready*. The controller may then conduct a serial poll to find the source of the request. In a serial poll the controller examines the *status byte* of each device in turn.

# 7.2.5.1 The Status Byte

The status byte register (read only) holds the status of all events for which it is possible to request service.

The status byte can be read by a serial poll command (which clears the RQS bit) or by an \*STB? command (which leaves the byte unchanged).

The status byte register is cleared by the commands *break* (BK), *clear status* (\*CLS), *reset* (\*RST) *initialize* (TT1) and *reset* (TT2), and on power-up.

128	64	32	16	8	4	2	1
END OF	RQS	ESB	MAV	END OF	END OF	END OF	END OF
FILE				PLOT	SWEEP	MEASURE	PROGRAM

The significance of these bits is as follows:

Bit	Event	Comments
128	End of file	Set when the end of file is reached, either after a <i>list file</i> command or when filing data. Cleared by the list file command, the <i>clear file</i> command, or by adding more data to the file (except when file is full).
64	RQS	Request service. Set when there is a correspondence between one or more of the bits set in the status byte register and one or more of the bits set in the service request enable register. Cleared by a serial poll or an *SREn command.

(Continued overleaf)

Bit	Event	Comments
32	ESB	Event status byte. Set when there is a correspondence between one or more of the bits set in the event status register and one or more of the bits set in the event status enable register. Cleared by an *ESEn command.
16	MAV	Measurement (or message) available. Set when there are data available to be read. The data may be measurement results, parameter query replies or anything being output to the GPIB. Cleared when the data are read.
8	End of plot	Set at the end of a plot. Cleared when a new plot is started.
4	End of sweep	Set at the end of a sweep. Cleared when a new sweep is started.
2	End of measure	Set when a measurement is completed. Cleared when a new measurement is started.
1	End of program	Set when a learnt program is completed. Cleared when a new program is started.

# 7.2.5.2 Service Request Enable

The instrument can be enabled to request service (and set the RQS bit) for one or more specified events. (Alternatively, if several of the status bits must be monitored simultaneously, the controller can be programmed to poll the status byte continually.)

To enable a service request send the remote command \*SREn. This sets the number n (in the range 0 to 255) into the service request enable register. "n" represents an event, or combination of events, for which service is to be requested. For example, n = 8 (STB 00001000) results in a service request at the next *end of plot* (see Fig 7.3).

SERVICE REQUEST ENABLE MASK (set-up code = \*SRE8)

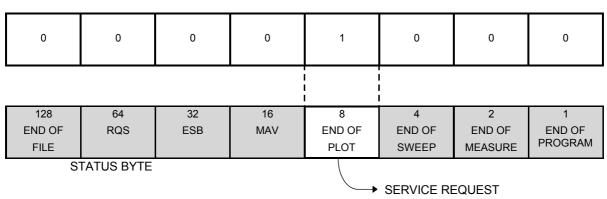

Figure 7.3 - Setting up a service request for "end of plot"

**7-8** 12600012\_Gmacd/CB

Once the instrument has requested service, the service request enable register must be set up again before another request can be made. The command \*SREn with which this is done also resets the RQS bit (bit 64) in the status register.

The service request enable register can be read with the command \*SRE?

# 7.2.5.3 Assigning Error Events

The error bit in the status byte register may have assigned to it any combination of the events stored in the event status register (ESR). This register (read only) can be read with the command \*ESR?

Error events are assigned by setting the appropriate bit(s) in the event status enable register (ESE) with the command \*ESEn. See the example in Fig 7.4.

The event status register is cleared by the commands *break* (BK), *event status enable* (\*ESE*n*), *event status query* (\*ESR?), *clear status* (\*CLS), *reset* (\*RST), *initialize* (TTI) and *reset* (TT2), and on power-up. The command \*ESE*n* also resets the ESB bit (bit 32) in the status byte register.

Remember that if an interrupt is required for the error event(s) then the error bit in the service request enable mask must be set to '1' (\*SRE32).

EVENT STATUS ENABLE (set-up code = \*ESE17)

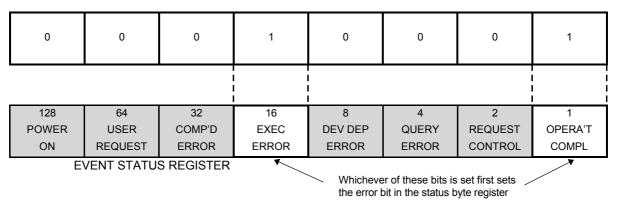

Figure 7.4 - Assigning "execution error" and "operation complete" to the status byte error bit

The significance of the event bits is as follows:

Bit		Event
128	Power On	Set when the power supply has been switched off and on.
64	User Request	Not used.
32	Command Error	Set by Error 01 and Error 02.
16	Execution Error	Set by Error 03 and Error 61.
8	Device Dependent Error	Set by any other errors or warnings.
4	Query Error	Set if an attempt is made to read non-existent data, or if a reading is aborted before all data is read.
2	Request Control	Not used.
1	Operation Complete	Set when the instrument has completed an operation. This bit must first be enabled by an operation complete (*OPC) command.

# 7.2.6 PARALLEL POLL

The instrument can be configured to give a parallel poll *true/false* response on a selected GPIB data line, to indicate whether or not the instrument is requesting service. However, the instrument must first be configured for serial poll (see Section 7.2.5.1 above).

To set up a parallel poll configuration send the remote command PPn, where n is an integer from 1 to 8 defining which GPIB data line is to carry the response.

Setting PARALLEL POLL to zero or sending PP0 unconfigures parallel poll.

To select the sense of the parallel poll line send the remote command PSn, where n = 1 signifies *true* and n = 0 signifies *false*.

The parallel poll response is also cleared by any change to the SERIAL POLL value, by any BREAK action-key selection, and by power-off.

Unlike serial poll, parallel poll need not be reconfigured after each service request. It is, however, cleared by the command \*SREn.

# 7.2.7 SUMMARY OF COMMANDS FOR IEEE 488 PROTOCOL

The following commands are supported by the instrument for IEEE 488 protocol:

Cmd	Action
*RST	Reset command, equivalent to the break command (BK).
*CLS	Clears the status byte register and the event status register. Any *OPC command is cancelled
*STB?	Queries the status byte register, leaving it unchanged.
*SREn	Sets the service request enable register to the bit pattern corresponding to <i>n</i> .
*SRE?	Queries the service request enable register, leaving it unchanged.
*ESR?	Queries the event status register, clearing it in the process.
*ESEn	Sets the event status enable register to the bit pattern corresponding to <i>n</i> .
*ESE?	Queries the event status enable register, leaving it unchanged.
*OPC	Enables the instrument to set the <i>operation complete</i> bit in the event status register when the idle state is next entered.
*IDN?	Instrument outputs the identifier string " 1260 IMPEDANCE ANALYZER, SOLARTRON, 0, 0"
*TST?	Starts a self test, on completion of which the instrument outputs the result: "0" for <i>fail</i> or "1," for <i>pass</i> . The front panel is left in self test mode, scrolling the rows. The next command clears this, or the operator can clear it by keying ENTER twice.
*RCLn	Recalls a stored setup. Equivalent action to the RSI command.
*SAVn	Stores the present setup. Equivalent action to the SSI command.

**7-10** 12600012\_Gmacd/CB

# 7.3 SERIAL INTERFACE

The serial interface is suitable for use with printers, display units and keyboards compatible with RS232 and RS423.

## 7.3.1 DATA HANDSHAKE

The instrument supports XON/XOFF data handshake. The ASCII commands XON (transmit on) and XOFF (transmit off) are recognised when outputting data to an external device. These commands are equivalent to the ASCII device control characters DC1 and DC3.

The instrument also asserts XOFF when it is busy, and XON when it is free. Full information is given in the standards:

- \* American National Standard Code for Information Interchange (ASCII) X3.4 1977
- \* BS 4730; The United Kingdom 7-bit data code (ISO-7-UK) February 1974, Section 5.3
- \* CCITT Volume VIII. 1 Recommendation V3 "International Alphabet No. 5".

#### 7.3.2 ECHO

The instrument *echoes* all characters received by the serial interface, unless the echo function is disabled. (See Chapter 5, Section 5.8.3.)

# 7.3.3 INPUT COMMAND TERMINATOR AND CHARACTER FRAME

Valid command terminators for the serial interface are *carriage return*, *line feed*, or *semi-colon*.

The character frame always contains one start bit, eight data bits, one stop bit and no parity.

# 7.3.4 SERIAL INTERFACE CONNECTOR

Connection to RS423 devices is made via the 25-way sub-miniature D-type connector on the serial interface. See Fig. 7.5. The pin functions are. shown in the connector detail.

## 7.3.5 BAUD RATE SWITCHES

The Baud rate of the serial interface is set by miniature toggle switches on the rear panel of the instrument. This function is described below. The remaining interface functions are set from the [RS 423 CONFIGUREI menu (Chapter 5, Section 5.8.3).

Set the RS423 baud rate to the required value (from 110 to 9600) by means of the 8-way BAUD RATE switch (Fig. 7.5).

Only one of the eight switches should be set in the down position, under the required baud rate.

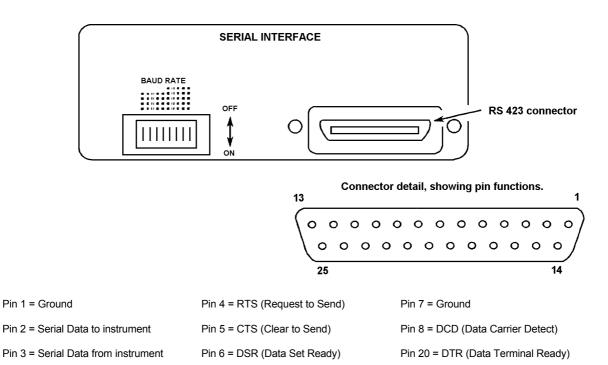

Figure 7.5 - Serial interface (on instrument rear panel)

# 7.3.6 OUTPUT TO THE SERIAL INTERFACE

The output of measurement results to the serial interface is controlled by the [DATA OUTPUT] RS423 setting (Chapter 5, Section 5.8 1). *All, fail,* and *pass* results are output in ASCII, and *dump* results in binary. The ASCII output can be selected for either a printer or a controller. Binary data can be interpreted only by a controller.

# 7.3.6.1 ASCII Output to a Printer

The *printer* format, selected from [RS423 CONFIGURE] MODE, is suitable for an 80 (or more) character-per-line printer. The results are separated by spaces, a complete result taking the form:

Variable Par. 1 Par. 2 Limits Check/Bin No Channel and error Time.

Each measurement result is terminated by an output *terminator*, selected from [RS423 CONFIGURE] TERM (Chapter.5, Section 5.8.3). Two of the terminators available include five *null* characters. These characters give a mechanical printer time to complete a carriage return, before receiving the next result. The exact content of the results output depends on the DISPLAY menu (Chapter 5, Section 5.5.4).

Column headings may be printed, or not, as selected by [FORMAT] HEADING on or *off.* Typical headings are:

FREQUENCY CAPACITOR PARALLEL R. LIMIT CHANNEL TIME (Hz) (F) (ohms) CHECK & ERROR

Column headings and results are automatically re-output when menu changes are made that affect their validity, e.g. changing the DISPLAY [COORDINATES] from r, $\theta$  to a,b.

# 7.3.6.2 ASCII Output to a Controller

The *controller* format, selected from [RS 423 CONFIGURE] MODE, is the same as that of the ASCII output to a talker/listener on the GPIB (see Section 7.2.4.2). The output terminator and separator are selected from the [R5423 CONFIGURE] menu (Chapter 5, Section 5.8.3).

Headings are not output when the controller format is selected, and the last result is not re-output after menu changes. Use' the 'DO' remote command to read the last result again, e.g. after changing the display *source*.

# 7.3.6.3 Dump Output

In *dump* output, selected from the [DATA OUTPUT] menu, each measurement result is output in binary form.

No headings are available and the last result is not re-output after menu changes. Use the 'DO' remote command to read the last result again, e.g. after changing the DISPLAY SOURCE.

No separators or terminators are available, as they cannot be distinguished from binary data.

# 7.4 DUMP OUTPUT FORMAT, for RS423 and GPIB

There are two types of dump output, *dump* and *dump all*. The binary numbers which make up these outputs are all in IEEE 754 standard format.

# 7.4.1 "Dump"Output

For each measurement the *dump* output produces' three floating"point numbers':"

ffff measurement frequency

aaaa in-phase component of the displayed

bbbb result quadrature component of the displayed result

e single byte error codeI single byte limits code

The coordinates available for the dump output are selected from the DISPLAY menu.

The single byte limit code (in 2s complement form) represents the result of a limits check: '1' = Hi, '-1' (= 255, or FF<sub>H</sub>) = Lo, and '0' = pass.

# 7.4.2 "Dump All" Output

For each measurement the *dump all* output produces nine floating point numbers:

ffff the measurement frequency

 $nnnn_1$  the generator amplitude

*nnnn*<sub>2</sub> the generator bias

aaaa<sub>1</sub>, bbbb<sub>1</sub> the in-phase and quadrature components of the Voltage 1 input

e single byte error code

 $\it aaaa_2,\,bbbb_2$  the in-phase and quadrature components of the Voltage 2 input

e single byte error code

aaaa2, bbbb2 the in-phase and quadrature components of the Current input

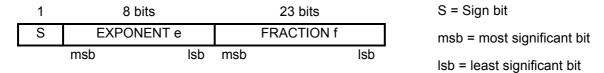

e single byte error code

The only coordinates available for the *dump all* output are a,jb.

**7-14** 12600012\_Gmacd/CB

# 7.4.3 FLOATING POINT FORMAT ("Dump" and "Dump All" Data)

The floating point format conforms to the ANSI / IEEE Standard 754. It consists of a 4-byte (32 bit) floating point number, as shown below:

The value of the number is  $(-1)^s 2^{e-127} (1.f)$  provided that 0 < e < 255

#### NOTE:

- 1. A zero sign bit indicates a positive number, a 1 sign bit indicates a negative number.
- 2. If e = 0 and f = 0, the value of the floating point number is zero.
- 3. If e = 255 and f = 0, the value of the floating point number is  $\pm \infty$

**EXAMPLE:** Converting a 4-byte floating point number to decimal.

Byte 1 contains 01000001<sub>2</sub> (most significant byte)

Byte 2 contains 11000000<sub>2</sub> Byte 3 contains 00000000<sub>2</sub>

Byte 4 contains 00000000<sub>2</sub> (least significant byte)

Arranged with the most significant byte on the left and the least significant byte on the right, these bytes form the following binary number:

From this:

The sign bit value of '0' indicates that the number is positive

The exponent value of  $10000011_2 = 131_{10}$  represents an exponent of:

$$2^{131-127}$$
=  $2^4$ 
=  $16_{10}$ 

The fraction part

Therefore the decimal equivalent of the floating point number is

$$1.5 \times 16 = +24$$

# 7.5 REMOTE/LOCAL CONTROL

The REMOTE/LOCAL facility enables the instrument to receive commands from either a *remote* or a *local* source. The remote facility is provided by the GPIB interface and has priority over local control.

The instrument offers two forms of local control:

- Local 1 Commands accepted from the instrument front panel and/or from the serial interface. The two sources have equal priority.
- Local 2 Commands accepted from the RS423 port only. No settings can be changed from the front panel, but the LOCAL key and the ON/OFF switch are still operative. The Menu keys can be used to examine, but not alter, the state of the controls.

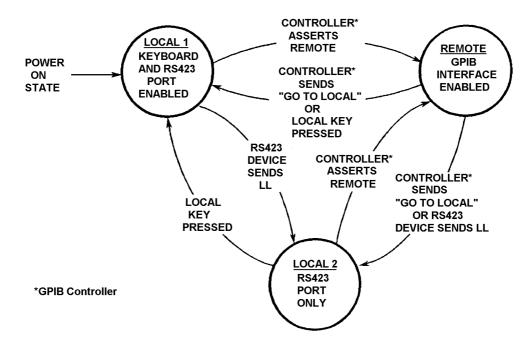

Figure 7.6 - REMOTE/LOCAL state diagram

The instrument powers up in LOCAL 1. Many GPIB controllers, however, automatically assert *remote* on power-up, in preparation for remotely controlling the system. Therefore, if the instrument is used in such a system it may be necessary to press the LOCAL key to allow local commands to be accepted. Figure 7.6 shows how the instrument control state is selected.

The program instructions for selecting LOCAL and REMOTE from the GPIB can be found in the GPIB controller operating manual. Note that a command to 'Go to Local' reselects the local state in use prior to the selection of REMOTE.

**7-16** 12600012\_Gmacd/CB

## 7.5.1 LOCAL LOCKOUT

The remote/local facility can have a local lockout condition superimposed by a command from the GPIB controller. Once local lockout is applied, control can be transferred only by the controller.

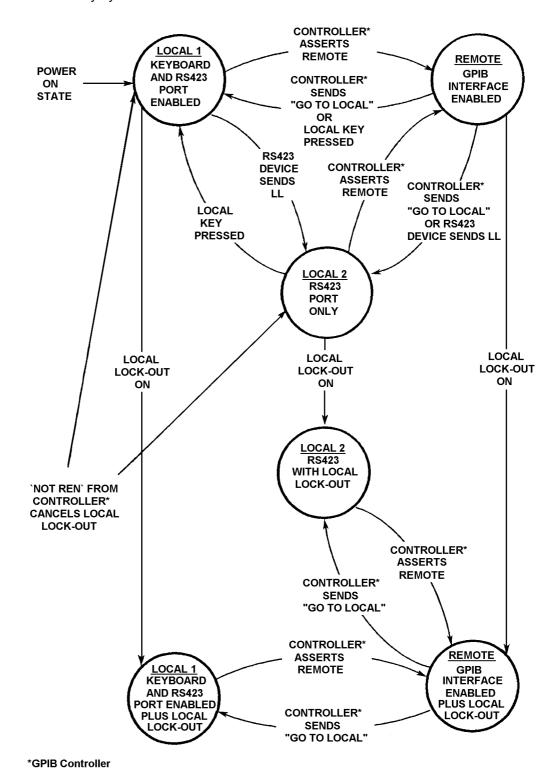

Figure 7.7 - State diagram of remote/local control with local lockout.

Local lockout prevents the control settings of the instrument being altered by unauthorized use of the front panel. Fig. 7.7 shows the relationship of local lockout to the remote and local states previously shown in Fig. 7.6.

As in Fig. 7.6, a GO TO LOCAL command from the controller reselects the local state previously in use.

The local lockout' state is cancelled' when the REMOTE ENABLE signal from the controller is negated, i.e. when the controller sends NOT REN.

## 7.5.2 COMBINED USE OF RS423 AND GPIB DEVICES

The instrument can be used in a system containing both GPIB and RS423 compatible devices.

For example, the GPIB controller could be a calculator with no recording capability, whilst the RS423 device could be a tape cassette unit, or a printer with no keyboard. Data requested by the GPIB controller, e.g. measurement results, are output also through the serial interface, provided that DATA OUTPUT for RS423 is enabled.

Conversely, if the instrument is set to *talk only*, and is connected to a *listen only* printer or plotter, data requested through the serial interface is sent also to the GPIB, provided that DATA OUTPUT for the GPIB is enabled.

However, if the instrument is set for operation as a talker/listener, data requested through the serial interface does not appear on the GPIB.

**7-18** 12600012\_Gmacd/CB

#### 7.6 CONTROL PROGRAM EXAMPLES

To demonstrate the use of the GPIB port for remote control of the instrument, several examples are given of GPIB Controller programs. Each example is written as a series of abbreviated commands, including some BASIC programming language instructions. The programs are representational only and are not necessarily suitable for directly programming a Controller.

#### 7.6.1 LANGUAGE USED IN PROGRAM EXAMPLES

The examples are intended to show the required sequence of events, as they affect the controls of the instrument. Other GPIB commands, such as Enable Signals and Addressing, are omitted. The most commonly used instructions are listed below, with a full explanation of their meaning.

Instruction	Meaning
OUTPUT "	Send to the instrument the string of characters within the inverted commas, plus a Command Terminator.
INPUT	Receive data from the instrument
INPUT A	Receive data from the instrument and store it in location A.
PRINT "FREQUENCY =", A	Print the statement: Frequency = "the value stored in location A".
DIM A\$(100)	The Controller is instructed to allocate sufficient temporary store space to accommodate a maximum of 100 character strings. A string could consist of a Learnt Program Command, a stored reading from the file etc. The store area is given the name A\$.
FOR I = 1 TO N	This is a loop instruction telling the controller to store
INPUT A\$(I)	each line of the instrument's output in area A\$, from line 1 to the final line N.
NEXT I	The loop instruction terminates when I = N

#### 7.6.2 EXAMPLE: Outputting Readings to the GPIB

The use of comma as separator and crlf as terminator is assumed.

Instruction	Meaning
OUTPUT "CV0"	Select co-ordinates a,b
OUTPUT "OP2,1"	Send all readings to the GPIB
OUTPUT "SI"	Make a Single measurement
INPUT F,A,B,E,L	Store the results of the measurement
PRINT "FREQ = ", F	Print the results of the measurement
PRINT "a = ", A	
PRINT "b = ", B	
PRINT "error = ", E	
PRINT "Limit check = ", L	

Note that the results sent to the GPIB ASCII port are from the same source channel and have the same co-ordinates as the results displayed on the Front Panel.

#### 7.6.3 EXAMPLE: Plotting Results from the History File, Using a Controller

First set up the sweep and plotter parameters of the instrument, using the "OUTPUT command" statement. The commands are listed in Chapter 8.

The controller program should now continue:

Instruction	Meaning
OUTPUT "*SRE4"	Configure for interrupt at end of sweep.
OUTPUT "RE"	Start repetitive measurements
•	
í	(Wait for interrupt)
OUTPUT "*SRE8"	Configure SRQ for end of plot
OUTPUT "PL"	Start plot.
	(Configure instrument to talk and plotter to listen.)
	(Wait for interrupt.)

#### 7.6.4 EXAMPLE: Outputting the History File to the GPIB

Instruction	Meaning
OUTPUT "*FP0?"	Query number of lines in File
INPUT N	N = number of lines in File
DIM A\$(N)	Allocate temporary store space
OUTPUT "OP2,1"	Output all readings to GPIB
OUTPUT "FO"	List File
FOR I = 1 to N	Start plot.
INPUT A\$(I)	Store all readings from File until I = N
NEXT I

#### 8.1 INTRODUCTION

This chapter lists the instrument remote commands. The commands are the same for RS423 and GPIB-operation. They are presented in menu order to relate to Chapter 5, "Menu Terms".

#### 8.2 COMMAND SYNTAX

The majority of codes are qualified by a numeric argument. In the following lists:

*F* is a floating point number  $\pm$  *n.nnnnnnn* E  $\pm$  *xx*,

I is an integer up to 2 digits,

*I,I* is two integers of up to 2 digits each, separated by a comma.

Default settings are shown in italics.

Including a query (?) with a command code, in any position, returns the associated parameter setting. Additional query commands are available for examining control information not accessible in this way.

#### 8.3 COMMAND SUMMARY

The command summary appears on pages 8.3 through 8.13.

	Group 6: Illegal input/Output	9.6	
	Group 7: System/Calibration	9.7	
	Group 8: Measurement Validity	9.8	
	Group 9: Store/recall	9.8	

#### 9.1 INTRODUCTION

Displayed messages tell the user:

- a) that an operation has been completed,
- b) that an undesirable situation exists, or
- c) that the requested operation is not possible.

Each message is preceded by number, e.g. "81. INPUT OVERLOAD". Where necessary, this number is included in the data output to remote devices as an error code. Messages are accompanied by a *beep*, unless this is switched off from [DISPLAY] ERROR BEEP. A message is displayed only briefly but can be recalled using the STATUS menu (μP, first page, LAST ERROR) or the ER? remote command.

Messages are classified according to the first digit of the message number. The meaning of each message is explained in this chapter, under the class number and area of application.

**9-2** 12600012\_Gmacd/CB

#### 9.2 ERROR CODE SUMMARY

#### 9.2.1 GROUP 0: COMMAND STRUCTURE

MESSAGE EXPLANATION

01. UNKNOWN COMMAND Command not included in instrument command set

02. ARG MISMATCH Command contained the wrong type, or wrong number, of

arguments.

03. OUT OF RANGE Argument value out of range.

04. FORMAT ERROR Floating point format error. Attempt made to enter a floating

point number in an incorrect format, e.g. 1.2.5E2 instead 1.25E2.

05. ILLEGAL REQUEST Illegal request for parameter value. Some control parameters

have no value, e.g. HS (sweep hold).

06. INVALID FUNCTION Function syntax error.

07. NO. OUT OF RANGE Integer out of range for store or constant in scaling function.
 08. INVALID SYMBOL Attempt made to enter an invalid symbol in scaling function.
 09. AMPL ILL. FOR HF
 Attempt made to enter an amplitude >1V at a frequency

Attempt made to enter an amplitude >1V at a frequency >10MHz.

#### 9.2.2 GROUP 1: LEARNT PROGRAM

MESSAGE EXPLANATION

11. ILLEGAL EDIT After EDIT has been selected, with an E*n* command, the only

valid commands are:

#F Select next instruction.

#B Select previous instruction.

#I Insert command(s) that follow as program instruction(s).

#D Delete presently selected instruction.

#Q Quit edit.

12. ILLEGAL COMMAND Command cannot be learnt. Some commands, e.g. En (edit),

cannot be used as learnt program instructions.

13. NO SUCH PROGRAM Program does not exist, under number specified.

14. NESTING ERROR Invalid recursion attempted. A program can execute itself only if

the execute program instruction (EPn) is the last instruction

entered before \*Q (quit).

(Continued on next page.)

Or, program "nesting" to more than five levels attempted. For example, the sequence:

P1:EP2→ P2:EP3→ P3:EP4→ P4:EP5→ P5:EP6→ P6:EP7 results in error message 14 at the command EP7. (P1:EP2 means "Program 1 commands the execution of Program 2", and so on.) However, if EP7 were EP1 then the sequence would be valid - just.

15. PROGRAM RUNNING Attempt made to edit a running program. Stop the program,

using BREAK, and try again.

16. PROG. CHKSUM ERR. Program checksum error. When learnt programs are stored in

memory a checksum is calculated and stored with the program data. Before a stored program can be used, a new checksum is calculated, and compared with the original. If the checksums disagree, the stored data is presumed to have been corrupted. The program is not executed and ERROR 16 is displayed.

The remedy is to initialize the instrument: the SUPERVISOR mode must be selected if the program number is 10 or above.

17. PROGRAM EXISTS Attempt made to learn a program, using the number of an

existing program. Previously learnt programs must be cleared before another program can be learnt under the same number.

18. PROG. CLEARED Specified program has been cleared.

19. COPY COMPLETE Specified program has been copied.

#### 9.2.3 GROUP 2: COMBINED PARAMETERS

MESSAGE EXPLANATION

20. SWEEP COMPLETE A measurement sweep has been completed.

21. SWEEP NOT SET UP Sweep limits, or increment/decrement, not entered.

Or, maximum<minimum.

22. GEN OVERLOADED Generator overloaded, due to excessive peak current demand,

i.e. peak ac+dc.100mA.

23. NULL/NORMALIZED Nulling or normalization complete.

24. ILL NULL SOURCE Source for null must be V1/I, V2/I, I/V1, I/V2.

25. PLOTTER LIM. ERROR X-MIN greater than X-MAX, or Y-MIN greater than Y-MAX, in

[PLOTTER SCALING] menu. Or, invalid MINIMUM or MAXIMUM value entered for a log item in the [PLOTTER X-

AXIS] or [PLOTTER Y-AXIS] menu.

9-4 12600012\_Gmacd/CB

27. GPIB/PLOTTER ERR. If results are to be plotted from the history file, the GPIB data

output should be set to [off]. Or, if results are to be plotted as measurements are made, the GPIB data output should be set to

[plotter].

28. NUL/NORMALIZE ON You are not allowed to change the sweep parameters when *null* 

or normalize is selected.

29. RENULL/NORMALIZE Present null/normalization data invalid, due to change in sweep

parameter(s) or null/normalization not yet done.

#### 9.2.4 GROUP 3: GENERATOR

MESSAGE EXPLANATION

31. GENERATOR KILLED Generator output *killed*. KILL signal applied to rear panel

connector: inner shorted to outer, or inner held at TTL logic `0`.

32. GENERATOR O/LOAD Generator overload, or power fail.

34. GEN RESTART Generator output reinstated. KILL signal removed from rear

panel connector.

#### 9.2.5 GROUP 4: LEARNT PROGRAM; HISTORY FILE; VERNIER

MESSAGE EXPLANATION
40. FILE CLEARED History file cleared.

41. LINE NO. ERROR Line number specified in a *jump* instruction (JP*i*) was not found.

(Line numbers can be assigned only in remotely compiled

programs).

42. ILLEGAL JUMP Jump has been commanded without learn program selected.

43. OUT OF RANGE Vernier adjustment attempted outside parameter range, when

parameter is already at maximum value. (The first attempt to enter a value outside the parameter range, with the present setting in range, results in the parameter being set to the maximum value: no error message is given at this time.)

44. FILE EMPTY History file empty.

45. ILL FILE ACCESS Illegal file access attempted. It is illegal to display, list, or clear

the history file whilst the analyzer is running.

Or plot attempted whilst measurement in progress. (Plot uses

file contents.)

46. ILL FILE SIZE	Sweep too large.	With [on] or [ev	valuate] selected for null or

normalize the following max. file sizes apply:

	Analyzer Mode	Max. File Size
null	normal	280
null	group delay	243
normalize	normal	243
normalize	group delay	192

47. FILE NOT EMPTY History file not empty. Attempt made to alter the file format

before clearing the file contents.

48. G. DELAY/FILE ERR. Incompatible file format. The analyzer is operating in *group* 

delay MODE, whilst the history file FORMAT is set for *normal* measurements. Initially the message is just a warning, but any attempt to display group delay parameters will cause the

message to be repeated.

49. VERNIER N/A Attempt made to adjust plotter parameters with vernier whilst

recycled measurements are being made. Or sweep in progress.

#### 9.2.6 GROUP 5: MISSING MODULES

These messages are returned when an attempt has been made to use a hardware module (printed circuit board) that is not fitted.

MESSAGE EXPLANATION

50. NO SUCH ANALYZER Analyzer not fitted.

52. NO GENERATOR Generator not fitted.

53. NO HF GENERATOR H F Generator not fitted.

54. NO ANALYZER CTRL Analyzer control not fitted.

55. NO SYNTHESIZER Synthesizer not fitted.

56. NO HF SYNTH. H F Synthesizer not fitted.

#### 9.2.7 GROUP 6: ILLEGAL INPUT/OUTPUT

MESSAGE EXPLANATION

60. ILL. I/O CHANGE Input/output device changed during *learn* sequence. The

input/output device (controller/front panel) was changed whilst a

program being learnt. The program was terminated

automatically but remains usable up to the point where the

change was made.

61. DEV. NOT ENABLED Attempt made to change operating conditions from a non-

enabled input/output device. For example, an RS423 device has attempted to send commands whilst the instrument is under *local lock-out* GPIB control. For more information on the combined use of RS423 and GPIB devices see Chapter 7,

Section 7.5.2.

9-6 12600012\_Gmacd/CB

(62) WARNING:V1 NOT DIFF Displayed if single-ended inputs are selected for the Voltage 1

input when an impedance measurement is made. Select differential inputs, otherwise the measurement will include the

impedance of the current analyzer.

(63) WARNING:V2 NOT DIFF Displayed if single-ended inputs are selected for the Voltage 2

input when an impedance measurement is made. Select differential inputs, otherwise the measurement will include the

impedance of the current analyzer.

64. AUTO-CLEAR OFF For NULL or NORMALIZE set CLEAR in FILE CONFIGURE to

[auto].

65. INTERLOCK Interlock signal negated during a binsort. Binsort suspended.

66. OPEN LOOP MODE The component handler has asserted the SOS line before

measurement completion. The handler is now in open loop mode. Measurements will continue in this mode, but are unlikely

to be valid.

67. SORTING FINISHED The specified number of components have been sorted. To sort

another batch another BF command must be sent or stop check

must be disabled (BS=0).

#### 9.2.8 GROUP 7: SYSTEM/CALIBRATION

MESSAGE EXPLANATION

70. OUT OF MEMORY No further memory is available for the operation attempted. To

make more room, delete any unwanted programs/functions and/or reduce size of program. ERROR 70 is also returned when attempt is made to copy to non-volatile memory when this

has insufficient room.

71. NV RAM CORRUPTED Non-volatile memory not initialized, or contents invalid. The

remedy is to initialize the instrument, with the *supervisor* mode

selected.

72. NOT SUPERVISOR Rear panel keyswitch incorrectly set. Some learnt program

operations can be performed only when the keyswitch is set to

SUPERVISOR.

73. CAL. DATA CLEARED Calibration data cleared.

74. I/P UNREASONABLE Input to channel being calibrated is outside calibration range.

75. CAL. DATA CORRUPT> One copy of calibration data is corrupted.

76. RECALIBRATE Both copies of calibration data are corrupted. Instrument should

be recalibrated as described in 1255/1260 Maintenance Manual.

77. ILL RANGE COMB. Autorange is not applicable. Attempt made to calibrate with

autorange selected. Or wrong combination of range

commanded.

78. ILL FREQUENCY Illegal frequency. Calibration frequency incorrectly set.

79. ILL CAL. SOURCE Illegal calibration source.

#### 9.2.9 GROUP 8: MEASUREMENT VALIDITY

MESSAGE EXPLANATION

81. INPUT OVERLOAD Overload on displayed channel(s).

82. AUTO INT. FAILED Auto-Integration terminated before valid result obtained.

83. O/L + A. INT FAIL Combination of Errors 81 and 82.

84. MONITOR FAILED Failure to reach the target value at the monitor input, within the

defined error %.

85. O/L + MON. FAIL Combination of Errors 81 and 84.
86. MON. + A. INT FAIL Combination of Errors 82 and 84.
87. OL, MON. + A/I FAIL Combination of Errors 81, 82 and 84.

88. AUTO IMPED ERROR When display CIRCUIT is set to [auto] the analyzer MODE must

be set to [auto impedance].

89. G. DEL NOT SET UP Group display not set.

#### 9.2.10 GROUP 9: STORE/RECALL

MESSAGE EXPLANATION

90. NO SUCH SET-UP Attempt made to recall or clear an empty set-up store; or a

checksum error has been detected on recalling a stored set-up.

91. SET-UP STORED Control set-up stored.
 92. SET-UP RECALLED Control set-up recalled.
 93. SET-UP CLEARED Control set-up cleared.

94. SET-UP EXISTS Set-up store in use. Before the store can be re-used it must be

cleared.

95. RESULT STORED Present result stored.

98. FUNCTION EXISTS Attempt made to write a function under a number which is

already in use. A used function must be cleared before a new

function can be written under the same number.

99. NO SUCH FUNCTION Attempt made to scale a measurement result by a non-existent

function.

9-8 12600012\_Gmacd/CB

12600012\_Gmacd/CB 10-1

**10-2** 12600012\_Gmacd/CB

#### 10.1 SCALING FACILITIES

Measurement results may be scaled in two ways:

- a) sweep measurements may be normalised, and
- b) individual results may have a scaling function applied to them.

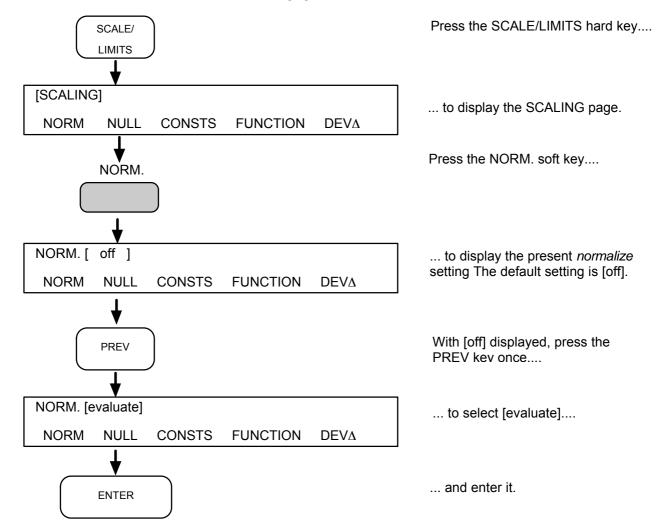

These two facilities may be used independently. When they are both used, normalisation occurs before function.

#### 10.2 NORMALIZING SWEEP MEASUREMENTS

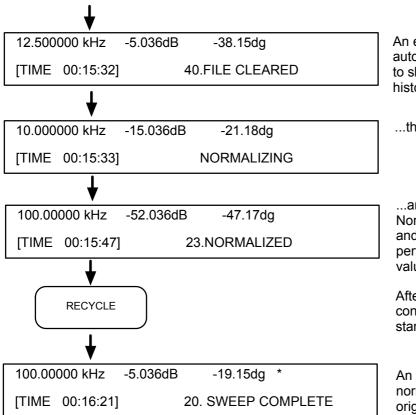

The normalize facility computes the ratio of two sets of values, *normalize* values and the values resulting from a subsequent measurement sweep. Two useful applications are:

- Separating measurement results from background data
- Measuring the effect of a modification on the item under test. Three simple steps normalize, modify, measure give measurement results that are related to the difference
  in the item under test, after modification.

To normalize a sweep, set up the initial test conditions, set the sweep parameters, ensure that DATA OUTPUT, FILE is set to [all] and then

12600012\_Gmacd/CB 10-3

An evaluate sweep then starts automatically and messages are displayed to show the sweeps progress. First the history file is cleared...

...then evaluation starts...

...and continues to the end of the sweep. Normalize [on] is selected automatically, and the results from any sweeps now performed are divided by the normalize values.

After setting up the secondary test conditions, press RECYCLE to start the measurement sweep.

An asterisk is displayed against each normalized result to show that it is not the original measured value.

While the sweep parameters remain at their present settings the normalize facility may be used as required, by entering NORM. [on] or [off].

Changing the sweep parameters after [evaluate] has been entered invalidates the present normalize values, "29. RENORMALIZE", until [evaluate] is entered again.

**10-4** 12600012\_Gmacd/CB

#### 10.3 SCALING A MEASUREMENT

Individual measurements are scaled by entering a user-defined scaling *function* and then selecting "FUNCTION" as the display source. A scaling function may include user-defined scaling *constants*.

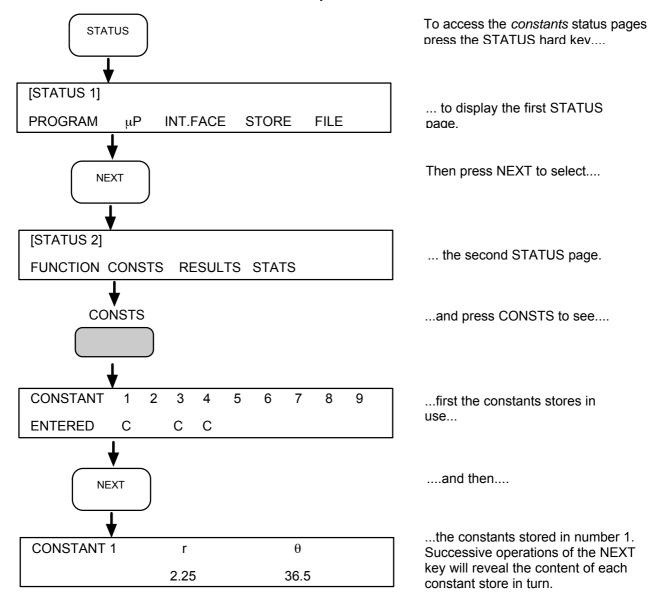

Eighteen scaling *functions* may be stored, nine in battery-maintained memory and nine in non-volatile memory. Nine scaling *constants* may be stored, in battery-maintained memory.

#### 10.3.1 CHECKING THE CONSTANTS STORE

Before trying to enter a constant check that a slot is available for it.

If the instrument has been initialized since constants were last entered then the constants store will be completely clear and user-defined values may be entered under any number from 1 through 9, as described in Section 10.3.2.

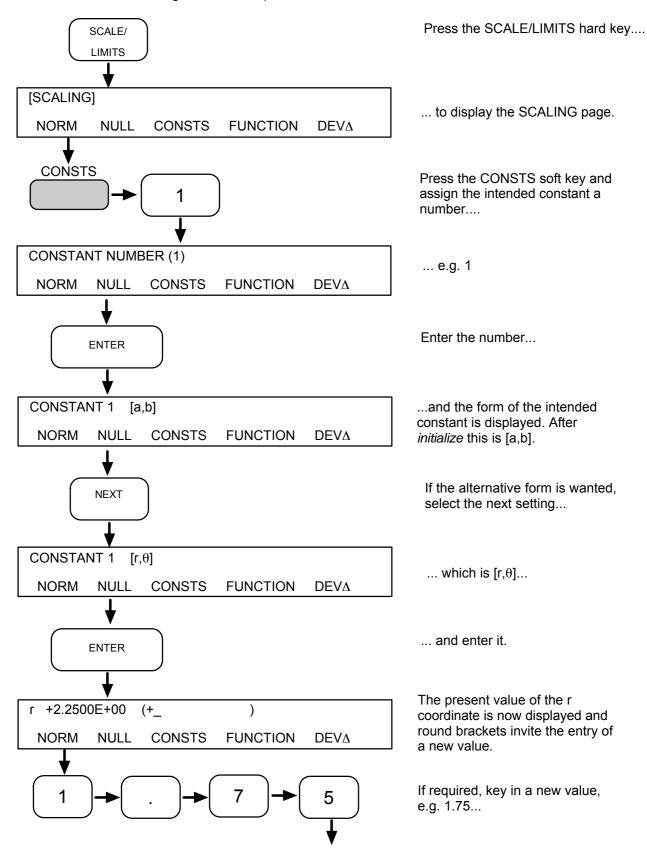

If the instrument has not been initialized and you are uncertain of the constants stored, then the STATUS menu will show you. If space is not available, then you may overwrite the values stored under a constant slot already in use.

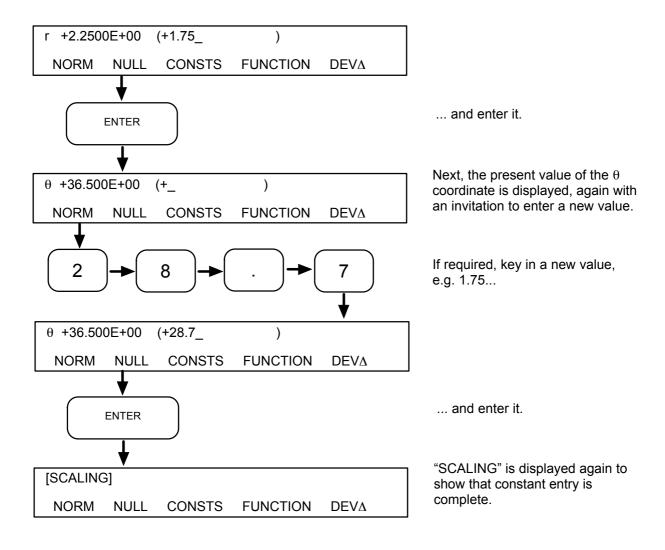

12600012\_Gmacd/CB 10-5

#### 10.3.2 ENTERING A SCALING CONSTANT

To enter a scaling constant, the procedure is:

**10-6** 12600012\_Gmacd/CB

12600012\_Gmacd/CB 10-7

#### 10.3.3 CHECKING THE FUNCTION STORE

Before trying to enter a function check that

- · a function slot is vacant (FUNCTION status) and
- sufficient memory space is available to hold the function (PROGRAM status).

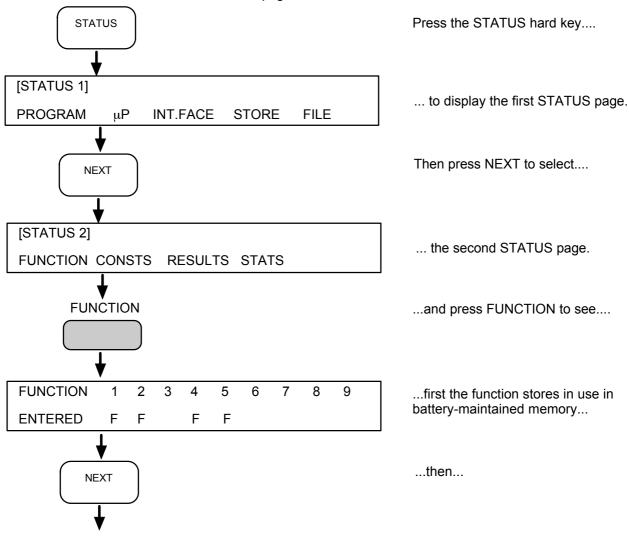

If the instrument has been initialized since the functions were last entered then user-defined scaling functions may be entered under any number from 1 through 9, as described in Section 10.3.5.

If the instrument has not been initialized and you are uncertain of the contents of the function store, then the FUNCTION pages of the STATUS menu will show you. When all function slots are in use, you may clear unwanted functions selectively, as described in Section 10.3.4.

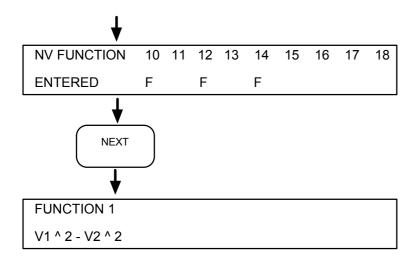

Stored functions and learnt programs use the same area of memory and the availability of this, for battery-sustained and non-volatile memory, appears under PROGRAM on the first STATUS page. A function uses two memory blocks.

#### 10.3.3.1 Accessing the Function Status Page

To access the FUNCTION status pages:

**10-8** 12600012\_Gmacd/CB

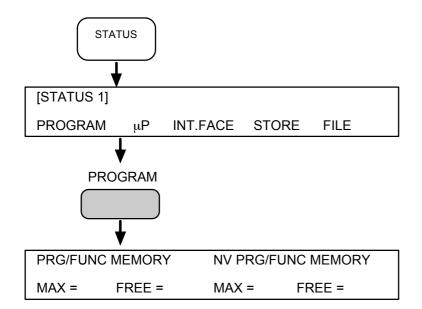

...the function stores in use in non-volatile memory...

...and then, with each successive press of the NEXT kev...

...the functions stored.

#### 10.3.3.2 Accessing the Program/Function (Memory) Status Page

To access the program/function memory status page:

Press the STATUS hard key....

... to display the first STATUS page.

Then press the PROGRAM soft kev....

...to select the first page of program status information. This shows the memory space available, both in battery-maintained and non-volatile memory.

12600012\_Gmacd/CB 10-9

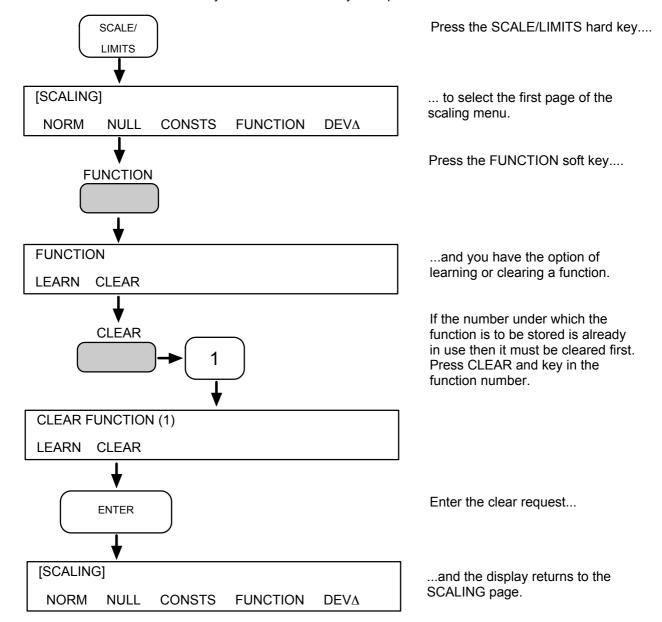

#### 10.3.4 CLEARING A SCALING FUNCTION

If none of the functions presently stored in the instrument are wanted then the whole program/function memory may be cleared by initializing the instrument. Remember, however, that this will also erase the history file and other stored data and set the control settings to their default states.

The battery-maintained program memory (program/functions 1 through 9) is always cleared on initialization, but the non-volatile memory (program/functions 10 through 18) is cleared only if the instrument is operating in the supervisor mode, i.e. when the PROGRAM keyswitch on the instrument rear panel is set to SUPERVISOR and INITIALIZE has been commanded.

If you wish to keep the contents of the non-volatile memory, always set the PROGRAM keyswitch to NORMAL before initializing the instrument.

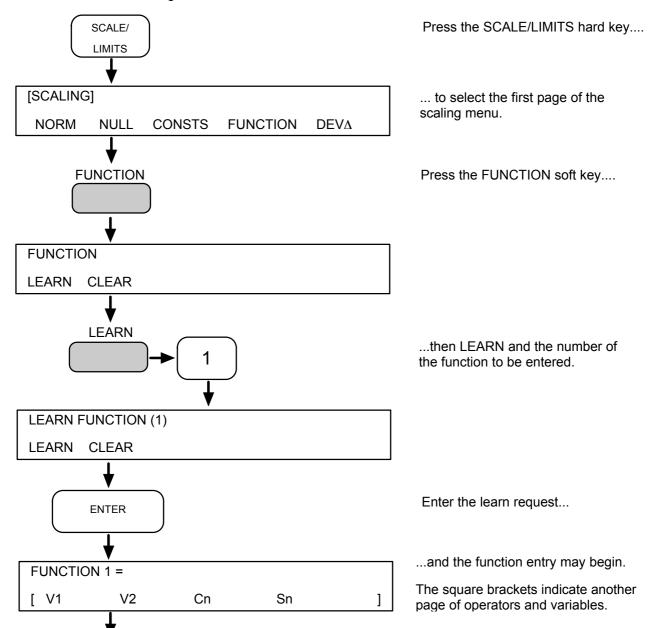

If some functions are wanted, or if you do not wish to initialize the instrument, then unwanted functions may be cleared selectively. The procedure is:

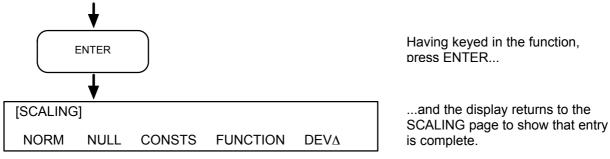

**10-10** 12600012\_Gmacd/CB

#### 10.3.5 ENTERING A SCALING FUNCTION

To enter a scaling function:

A scaling function may now be created, from the operators and variables displayed. (An example is given in the next section.) To ensure the correct syntax, only the valid choices are shown: this choice is updated as each item is keyed in. The square brackets indicate that further operators and variables are available (selected with NEXT or PREV).

#### 10.3.6 SCALING FUNCTION EXAMPLE

A practical example shows how scaling functions work. In this particular case the open-loop gain (A) of an amplifier is computed from the closed-loop gain (A'), using the function

$$A = \frac{A'}{1 - RA'}$$

where

$$A' = \frac{V_o}{V_i} = \frac{V_2}{V_1}$$

and

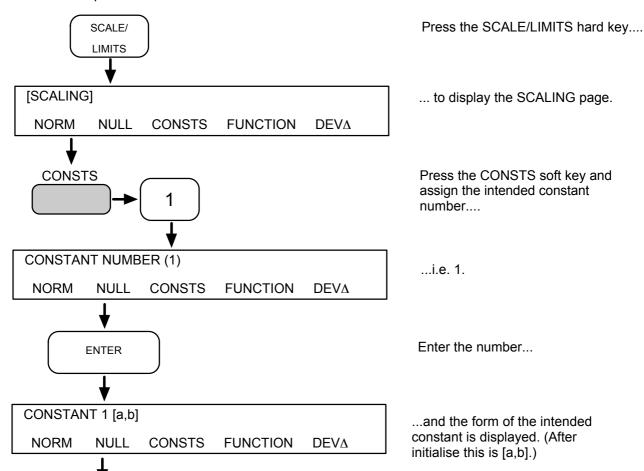

$$R = \frac{R_{input}}{R_{feedback}}$$

Note that all functions use vector arithmetic, i.e. V1 = a + jb

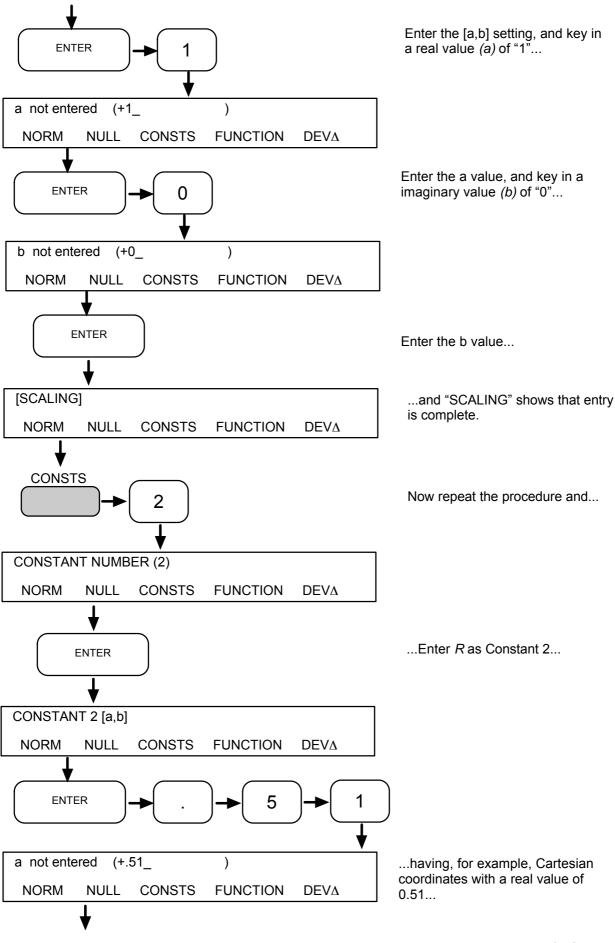

# 10.3.6.1 Assigning Fixed Values

Fixed values are assigned to a function from stored results (Sn) and user-defined constants (Cn). In the present example, therefore, the values "1" and R are stored as constants. This is done before entering the function itself.

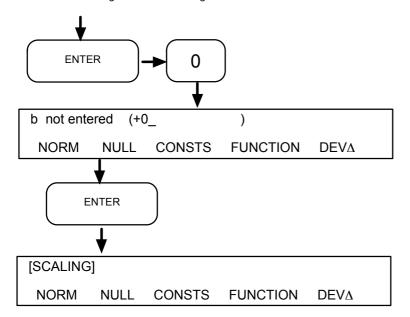

The procedure is:

**10-12** 12600012\_Gmacd/CB

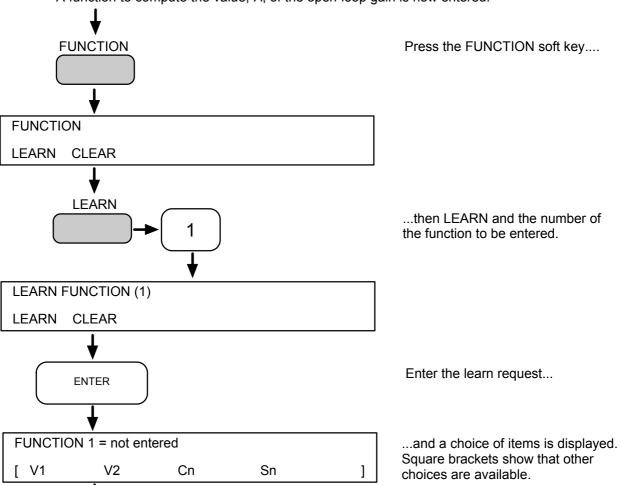

...and an imaginary value of zero.

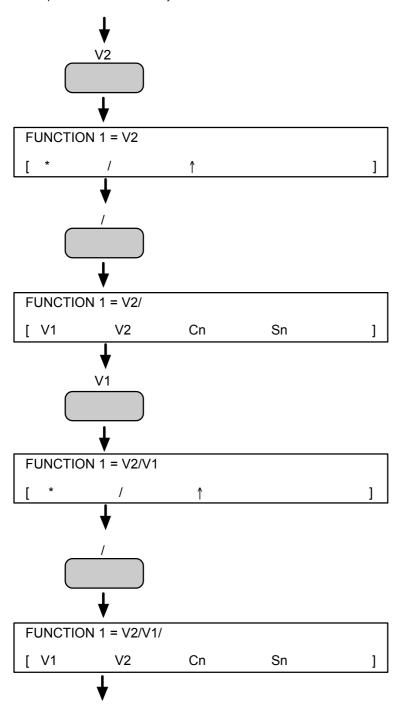

The fixed values "1" and *R* are now held as constants.

# 10.3.6.2 Entering the Function

A function to compute the value, *A*, of the open-loop gain is now entered.

**10-14** 12600012\_Gmacd/CB

Key in the first item, which, in the present example, is V2....

This item appears after "FUNCTION 1 = ", and the next selection of items appears.

As the example shows it is a simple matter to key in the rest of the function. All that is needed is a little thought as to the action of the operators. These act from left to right, at the following priorities:

1st priority: powers and negative powers, represented by "↑" and "-↑"

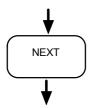

2nd priority: division and multiplication represented by "/" and "\*".

3rd priority: addition and subtraction, represented by "+" and "-".

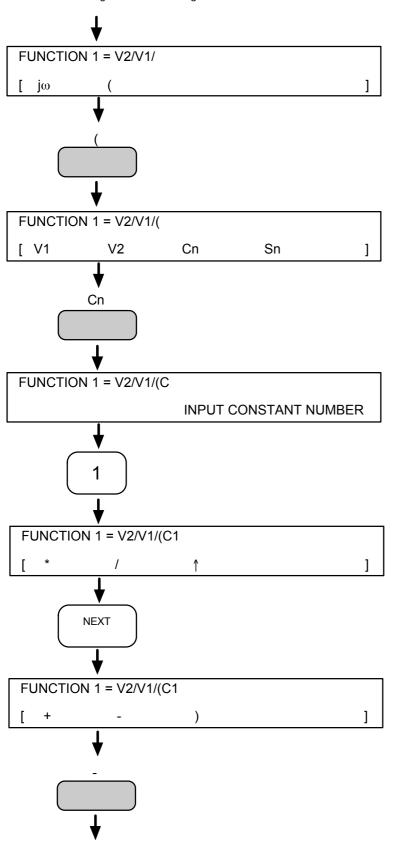

Brackets tie several terms together, so that a common operator can be applied. An example of this is given on the next page.

The function keyed in so far is:

$$F_1 = \frac{\frac{V_2}{V_1}}{V_1}$$

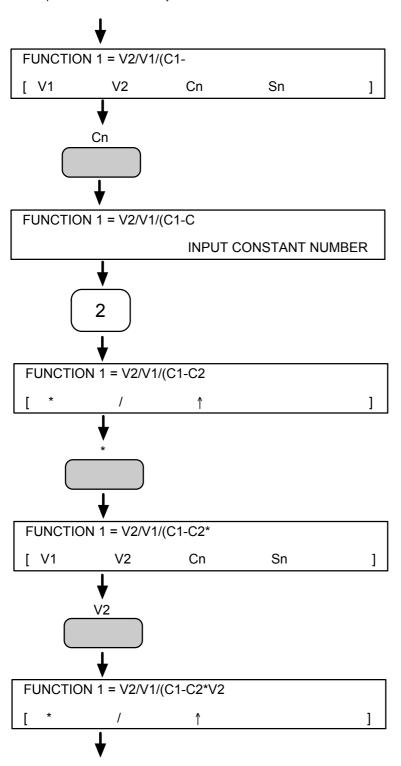

An open bracket is needed now, so press NEXT to display the alternative items.

The function keyed in so far is :

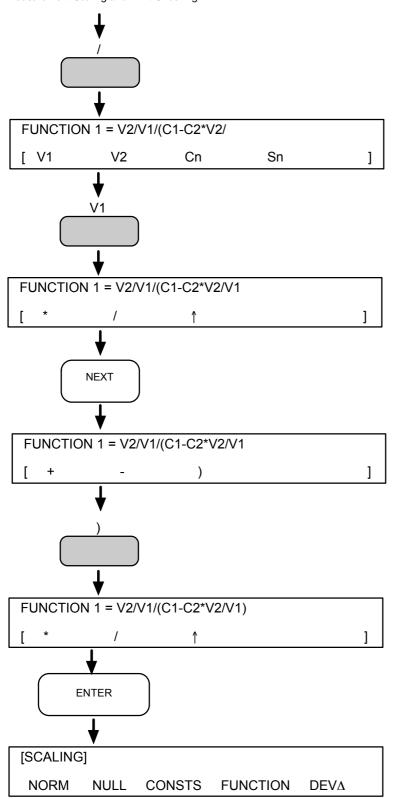

$$F_1 = \frac{\frac{V_2}{V_1}}{C_1}$$

10-16

The function keyed in so far is:

$$F_1 = \frac{\frac{V_2}{V_1}}{C_1 - C_2 V_2}$$

Function 1 is now ready to apply, as:

Having keyed in the function, press  $\ensuremath{\mathsf{ENTER}}....$ 

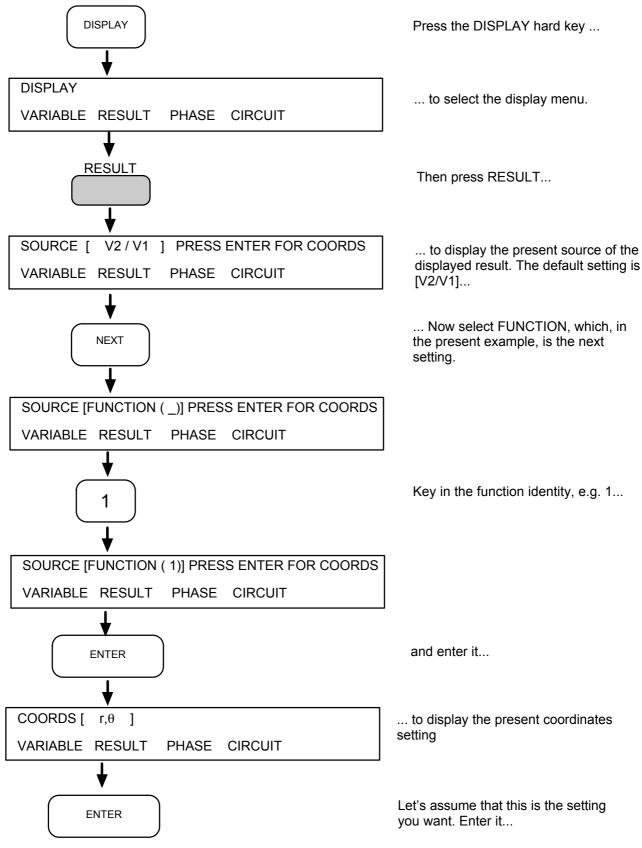

...and the display returns to the "SCALING" page to show that entry is complete.

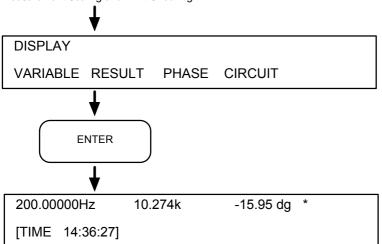

$$F_1 = \frac{\frac{V_2}{V_1}}{C_1 - C_2 \frac{V_2}{V_1}}$$

10-18

#### 10.3.7 APPLYING A SCALING FUNCTION

Once a scaling function has been entered (as shown in the previous section) it is applied by selecting "FUNCTION" as the display source. The procedure is:

...and "DISPLAY" is displayed again to show that entry is complete.

Press ENTER again...

...to display the present measurement result in its scaled form. All other measurements displayed will be scaled in the same way, until a different display source is entered.

**10-20** 12600012\_Gmacd/CB

#### 10.4 THE LIMITS FACILITY

Measurement results may be checked against a user-defined limits, which define pass and fail zones. Fig 4.1 shows the set-up:

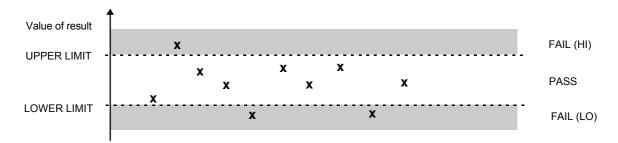

Fig 4.1 Pass and fail zones, as defined by the upper and lower limits.

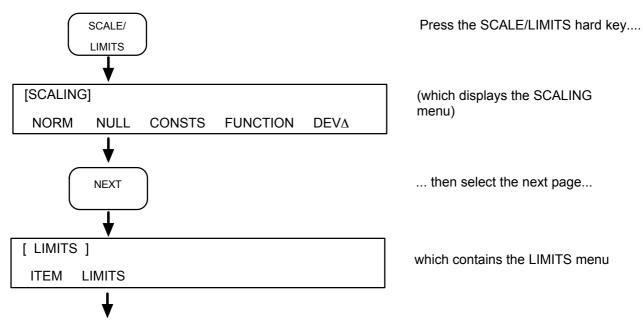

An upper limit defines the ceiling, and a lower limit defines the floor, of the measurement pass zone. The pass condition is "lower limit  $\leq$  result  $\leq$  upper limit", whilst the fail condition is "result < lower limit" or "result > upper limit". The example in Fig 4.1 shows ten measurement results, each represented by an "x": seven results have passed the check and three have failed.

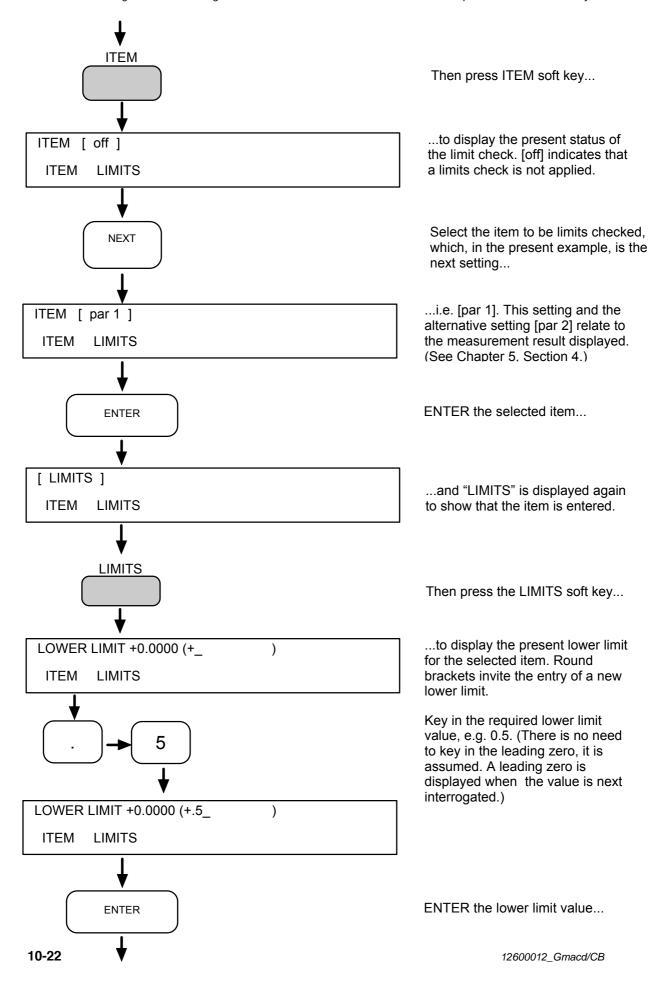

In accordance with the limits check, "Hi" or "Lo" is displayed against failed results.

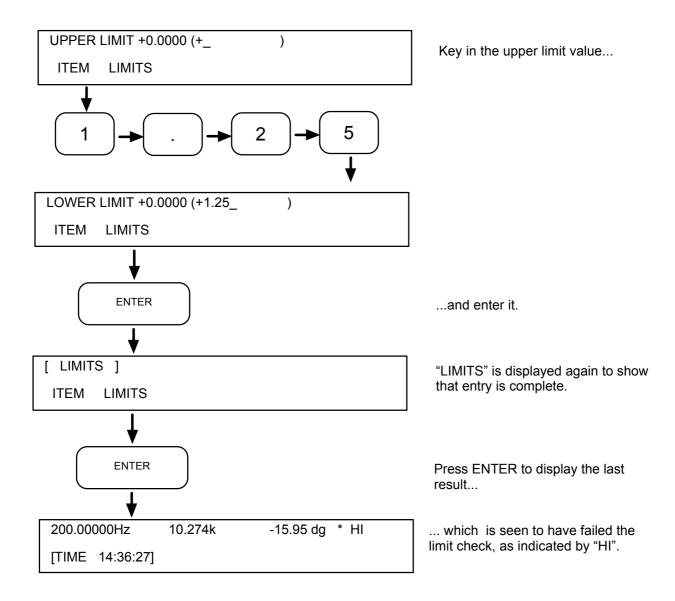

Once a limits item has been entered, output data may be restricted to *pass* or *fail* results. The choice, for each output port, is made from the DATA OUTPUT menu.

#### 10.4.1 SETTING THE LIMITS

To enter the limits the procedure is:

# 11.1 LEARNT PROGRAM FACILITIES

The instrument is able to store a series of commands, which may be actioned later as a *learnt* program. A learnt program is useful where a test sequence is used repeatedly, as, for example, in production testing. Up to eighteen programs may be stored.

Each learnt program instruction is equivalent to a single menu entry.

A *set-up recall* instruction allows a complete instrument set-up to be recalled. This reduces the number of instructions necessary when altering groups of settings throughout the test. Single acting instructions need to be used only for sequential operations.

The learnt program facilities are presented under three hard keys, LEARN PROG, EXECUTE PROGRAM, and STATUS. The LEARN PROG functions are:

**Learn** Sets the instrument into the learn program mode in which it interprets each

command as a learn program instruction. Programs are learnt under program

numbers 1 through 9.

**Edit** Allows a learnt program to be modified. Only programs 1 to 9 may be edited.

To edit a program in non-volatile memory (programs 10 to 18) copy the program to a program number between 1 and 9, edit it, clear the original

program and copy it back.

**Clear** Clears an unwanted learnt program from memory.

**Copy** Copies a complete learnt program under another program number. This

facilities is used for transferring a learnt program to non-volatile memory. It

may also be used, with EDIT, to derive one program from another.

EXECUTE PROGRAM allows a selected program to be executed.

The STATUS 1, PROGRAM pages show the memory space available for program storage.

#### 11.1.1 PROGRAM STORAGE

Programs 1 through 9 are held in the battery-maintained memory. There is also room for nine programs in non-volatile memory, under program numbers 10 through 18. Use COPY to transfer important programs to locations 10 through 18: the original programs may then be cleared, so that other programs may be learnt.

#### 11.1.2 PROGRAM KEYSWITCH

A PROGRAM keyswitch on the instrument rear panel may be set to protect the learnt programs in non-volatile memory. Two switch settings are used:

• The SUPERVISOR setting allows learnt programs to be stored in, or recalled from, any location from 1 through 18. All programs may be cleared.

CAUTION: Do not switch the instrument on or off when the keyswitch is in the "Supervisor" mode.

 The NORMAL setting allows learnt programs to be recalled from any location, but stored only in locations 1 through 9. Only programs 1 through 9 may be cleared.

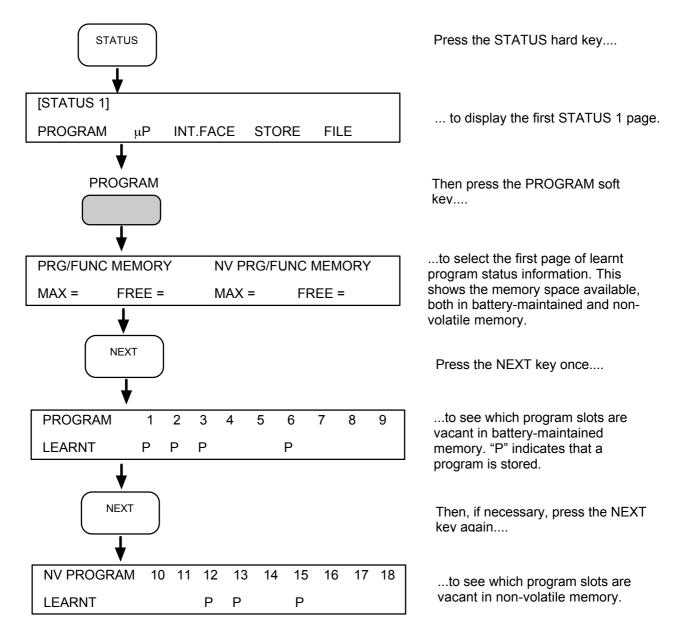

# 11.2 CHECKING THE PROGRAM MEMORY SPACE

Before trying to create a learnt program check that

- · a vacant program slot is available and
- sufficient memory space is available to hold all the instructions.

If the instrument has been initialized since programs were last entered then the learnt program memory will be completely clear and a program may be created under any number from 1 through 9, as described in Section 11.4.

If the instrument has not been initialized and you are uncertain about the contents of the program memory, then use the STATUS menu to find out what space is available:

If there is insufficient memory space for the intended program then the entire memory, or selected parts of it, may be cleared as described in Section 11.3.

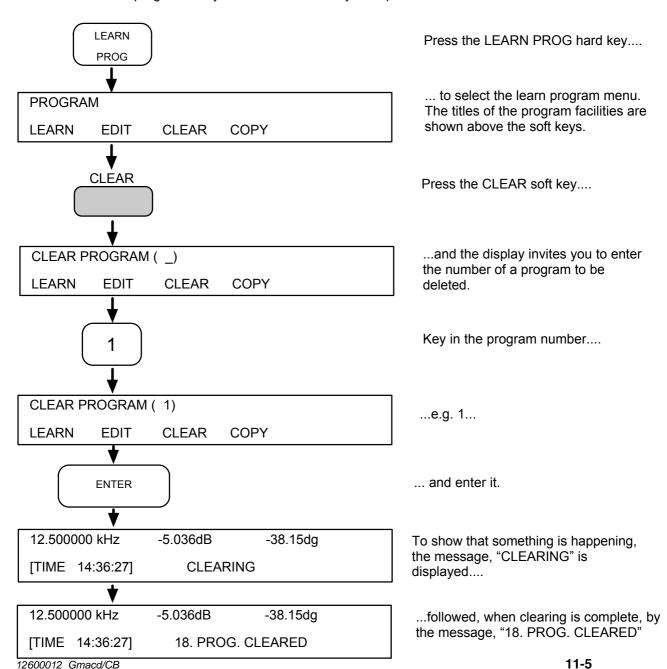

**11-4** 12600012\_Gmacd/CB

# 11.3 CLEARING A LEARNT PROGRAM

If none of the learnt programs presently stored in the instrument are wanted then the whole program memory may be cleared by initializing the instrument. Remember, however, that this will also erase the history file and other stored data and set the control settings to their default states. The battery-maintained program memory (programs/functions 1 through 9 and stored set-ups/results 1 through 9) is always cleared on initialization, but the non-volatile memory (programs/functions 10 through 18 and stored set-ups 10 through 16) is cleared only if the instrument is operating in the supervisor mode, i.e. when the PROGRAM keyswitch on the instrument rear panel is set to SUPERVISOR and INITIALIZE has been commanded.

If you wish to keep the contents of the non-volatile memory, always set the PROGRAM keyswitch to NORMAL before initializing the instrument.

If some learnt programs are wanted, or if you do not wish to initialize the instrument, then unwanted programs may be cleared selectively. The procedure is:

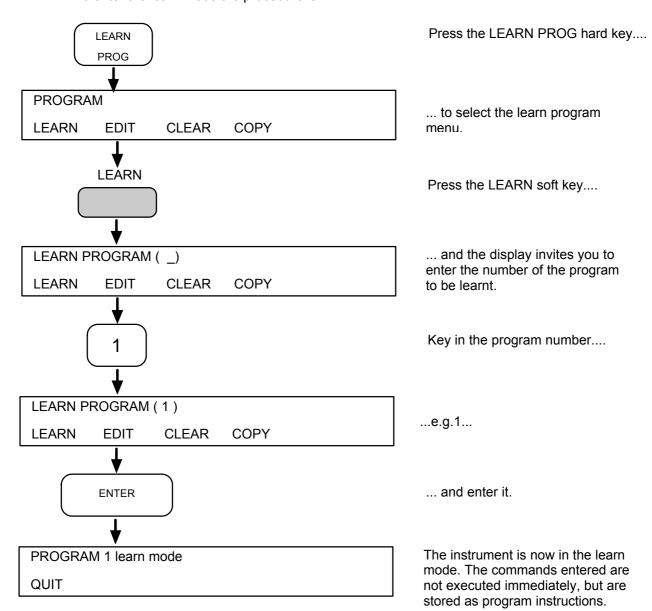

#### 11.4 CREATING A LEARNT PROGRAM

To create a learnt program, simply set the instrument into the learn program mode and then enter commands in the order in which they are to be executed. Remember that a recall set-up instruction can set any number of control parameters in one go. This is useful in tests that require several parameters (e.g. the SWEEP settings) to be altered part of the way through.

#### 11.4.1 ENTERING THE LEARN MODE

To enter the learn mode the procedure is:

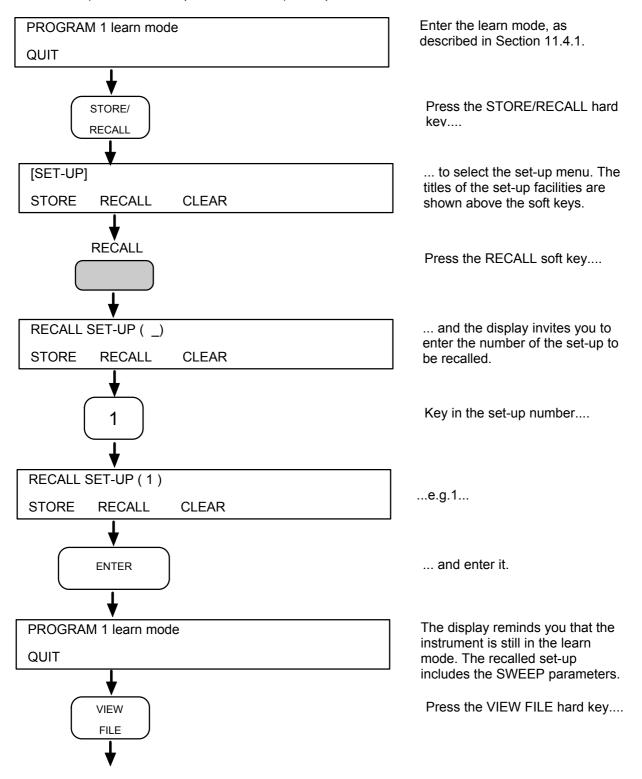

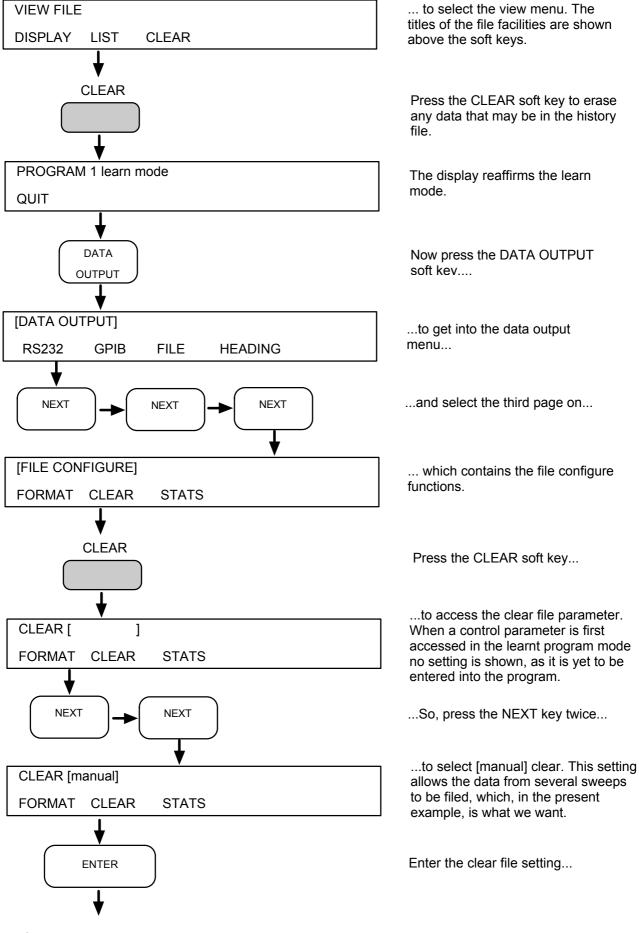

**11-6** 12600012\_Gmacd/CB

#### 11.4.2 LEARNT PROGRAM EXAMPLE

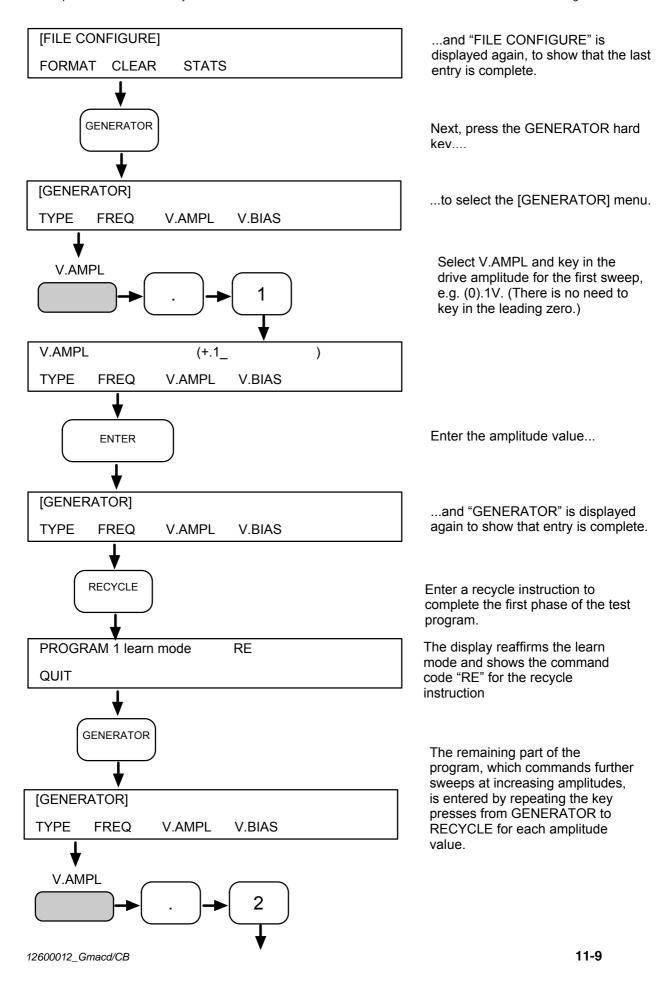

In the following example the instrument is programmed to subject the item under test to a series of frequency sweeps of increasing amplitude. The aim is to test the item for linearity.

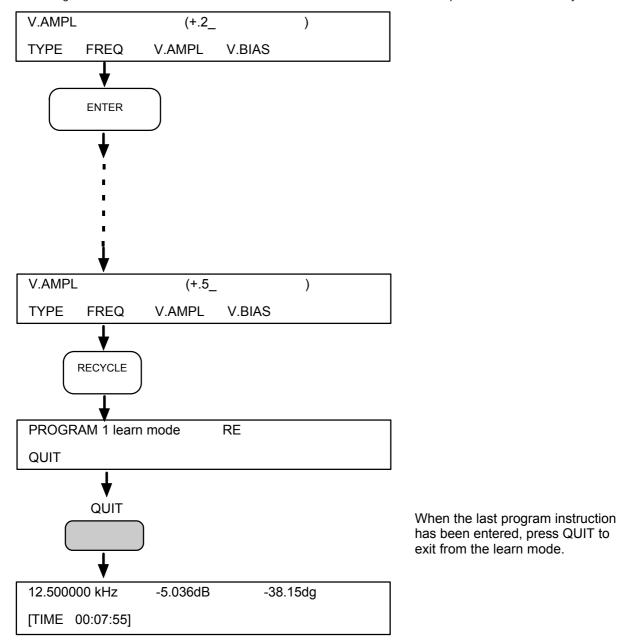

The procedure is: reset the control settings (as described in Chapter 3, Section 6.1), set up a frequency sweep (as described in Chapter 3, Section 7.1), store the set-up in store number 1 (similar to recall procedure below), then proceed as follows:

**11-8** 12600012\_Gmacd/CB

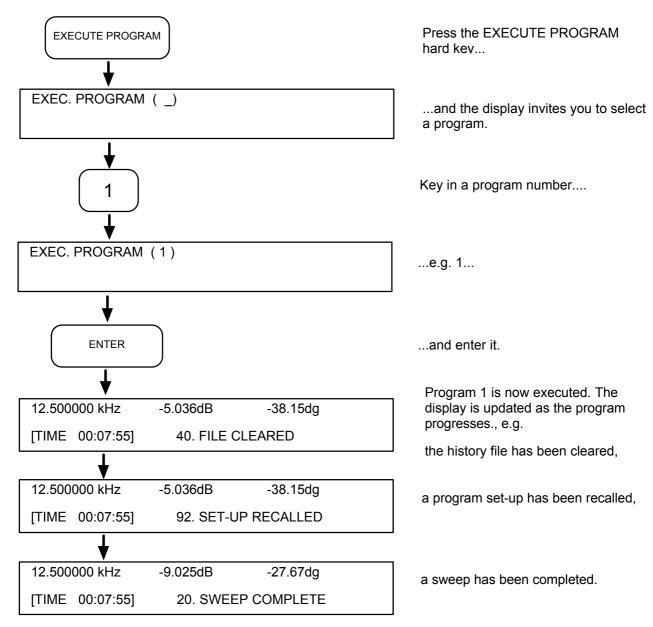

The instructions which make up this program can be seen in Section 11.6, "Editing a Learnt Program".

11-10 12600012\_Gmacd/CB

## 11.5 EXECUTING A LEARNT PROGRAM

A program is started simply by entering the program number from EXECUTE PROGRAM. The procedure is:

When the example program is finished the basic data of five sweeps, made at increasing drive signal amplitudes, are contained in the history file. With the sweep set for 50 measurement points this amounts to 250 data blocks.

Results may now be displayed in various formats, by selecting the appropriate source and coordinates from the DISPLAY menu. The results may then be

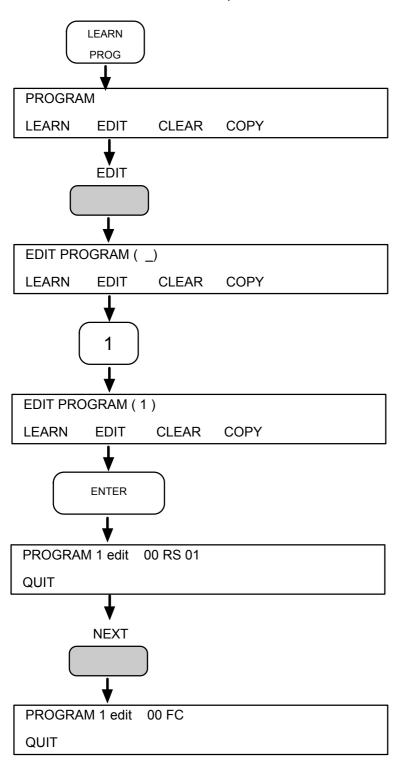

- · displayed in succession, with the VIEW FILE facility,
- · plotted, with the PLOT facility, and/or
- output to remote devices via the GPIB or RS232 ports.

#### 11.6 EDITING A LEARNT PROGRAM

EDIT allows a learnt program to be altered. Instructions may be inserted or deleted.

#### 11.6.1 ENTERING THE EDIT MODE

To enter the edit mode the procedure is:

Press the LEARN PROG hard key....

... to select the learn program menu. The titles of the program facilities are shown above the soft keys.

Press the EDIT soft key....

... and the display invites you to enter the number of the program to be edited.

Key in the program number....

...e.g.1...

... and enter it.

The first instruction in the program is now displayed, in the form of a command code. This particular code means, "Recall set-up 1".

Each program instruction may be selected in turn, with the NEXT soft key.

The second instruction, now displayed, is the code FC which means, "Clear history file".

The command codes for the complete program are listed on the next page.

**11-12** 12600012\_Gmacd/CB

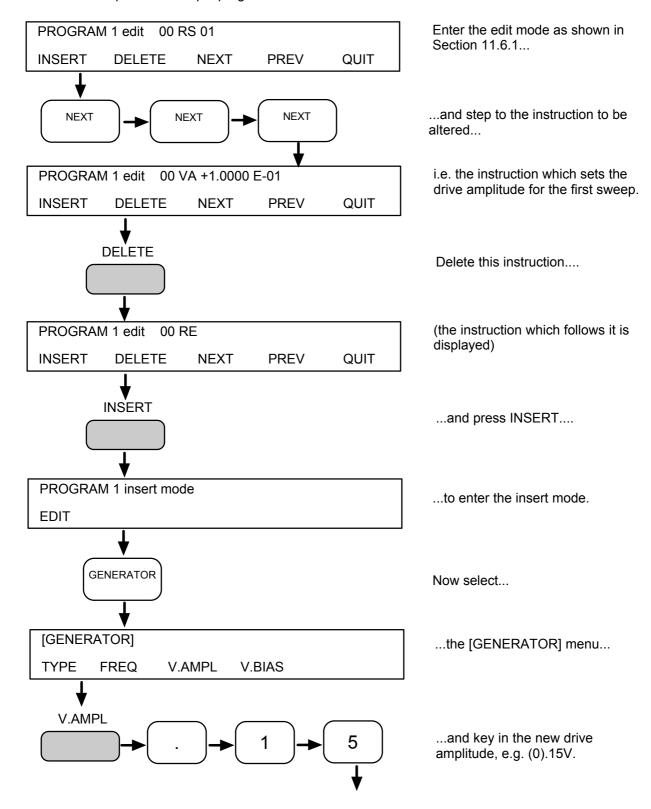

# 11.6.2 LISTING OF EXAMPLE PROGRAM

Command code	Comments		
00 RS 01	Recall set-up number 1		
00 FC	File Clear, i.e. clear the history file		
00 MC 01	Set history file clear mode to manual. This inhibits the automatic file clear function and allows the history file to store the data from several sweeps.		
00 VA +1.0000E-01	Set the drive signal amplitude to 0.1V		
00 RE	Recycled measurements. This command takes the instrument through the first sweep.		
00 VA +2.0000E-01	Set the drive signal amplitude to 0.2V		
00 RE	Recycled measurements. This command takes the instrument through the second sweep.		
00 VA +3.0000E-01	Set the drive signal amplitude to 0.3V		
00 RE	Recycled measurements. This command takes the instrument through the third sweep.		
00 VA +4.0000E-01	Set the drive signal amplitude to 0.4V		
00 RE	Recycled measurements. This command takes the instrument through the forth sweep.		
00 VA +5.0000E-01	Set the drive signal amplitude to 0.5V		
00 RE	Recycled measurements. This command takes the instrument through the fifth sweep.		
99 #Q	Quit program.		

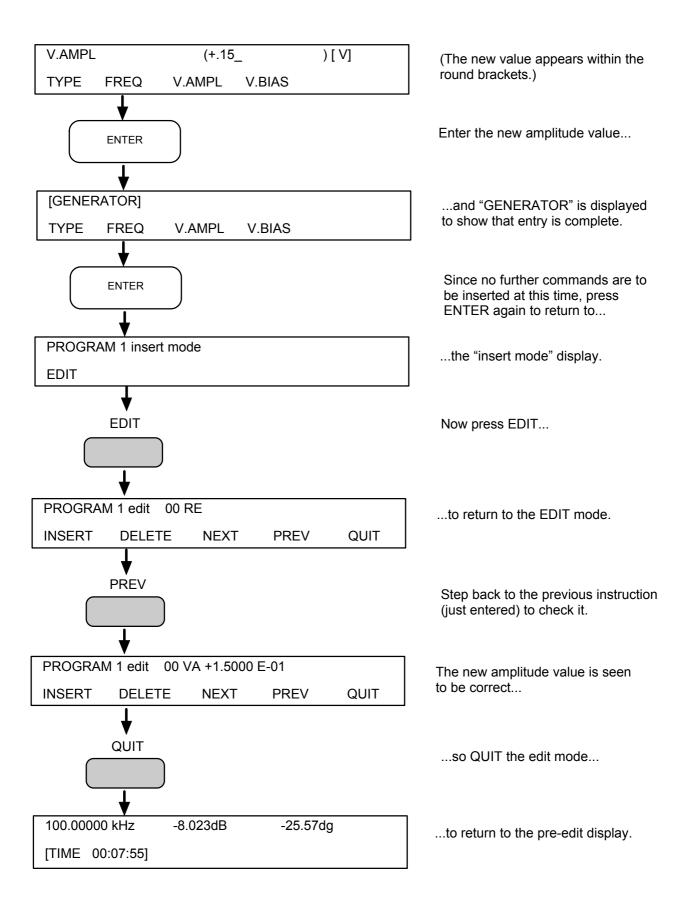

This program may be modified as shown in Section 11.6.3.

#### 11.7 USING THE EDIT FUNCTIONS

The way in which the edit functions are used to modify a program is shown in the following example. In this particular sequence the aim is to change the drive amplitude of the first sweep in the example program.

**11-14** 12600012\_Gmacd/CB

#### REMEMBER THE LEARNT PROGRAM RULES:

- A program may call another program as a sub-routine, from anywhere within itself. This sub-routine, in turn, may call a sub-sub-routine, and program "nesting" may be extended in this way up to five levels (counting the initial program as the first level). A sixth level is permitted on one condition, that the routine at this level calls the initial program on completion.
- A program may execute itself, but only if the execute instruction is the last one in the program.

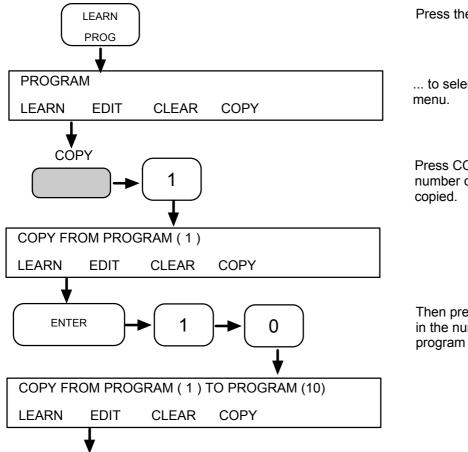

### 11.8 COPYING A LEARNT PROGRAM

COPY allows a complete learnt program to be copied, under another program number. This facility is used for transferring learnt programs to non-volatile memory (program numbers 10 through 18). It may also be used, with EDIT, to derive one learnt program from another.

Note that the instrument must be operating in the supervisor mode for programs to be copied to program numbers 10 to 18. To protect these programs it is advisable to return the instrument to the normal mode immediately after copy complete, otherwise the programs may be corrupted by an inadvertent initialize.

#### 11.8.1 COPY PROCEDURE

The copy procedure is:

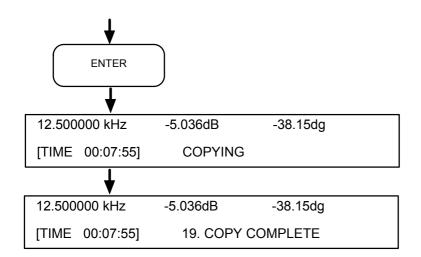

Press the LEARN PROG hard key....

... to select the learn program menu.

Press COPY and key in the number of the program to be copied.

Then press ENTER, and then key in the number under which the program is to be copied.

**11-16** 12600012\_Gmacd/CB

Enter the request...

...and, to show that something is happening, the message, "COPYING" is displayed...

...followed, when copying is complete, by the message, "19. COPY COMPLETE".

If a program is to execute itself (via an EPn instruction) remember to change the number n to the "copy to" program number.
