1 Introduction

1.1 Scope and definitions

This manual provides installation, operation and maintenance instructions for the Edwards range of accessories for the following EXT pumps:

- EXT70 and EXT70H turbomolecular pumps.
- EXT75DX and EXT75iDX compound molecular pumps.
- EXT250 and EXT250M turbomolecular pumps.
- EXT250H and EXT250Hi compound molecular pumps.
- EXT255H and EXT255Hi compound molecular pumps.
- EXT255DX and EXT255iDX compound molecular pumps.
- EXT351 and EXT501 turbomolecular pumps.
- EXT555H, EXT555HF, EXT555Hi, EXT555HE and EXT556 compound molecular pumps.
- EXT406PX and EXTPX split flow compound turbomolecular pumps.

The accessories are shown in Figure 1 and 2. The Item Numbers for the accessories are listed in the appropriate sections. You must use the accessories as specified in this manual. Read this manual before you install accessories onto your EXT pump.

Important safety information is highlighted as WARNING and CAUTION instructions; you must obey these instructions. The use of WARNINGS and CAUTIONS is defined below.

**WARNING**

Warnings are given where failure to observe the instruction could result in injury or death to people.

**CAUTION**

Cautions are given where failure to observe the instruction could result in damage to the equipment, associated equipment and process.

Throughout this manual, page, figure and table numbers are sequential.

The units used throughout this manual conform to the SI international system of units of measurement. When flow rates are specified, the abbreviation 'sccm' is used to mean 'standard cm³ min⁻¹': this is a flow of 1 cm³ min⁻¹ at an ambient temperature of 0 °C and a pressure of 1013 mbar (1.013 x 10⁵ Pa).

In accordance with the recommendations of EN61010, the following warning labels may appear on the pump or its accessories:

Warning - refer to accompanying documentation.
1.2 Installation and operation safety

**WARNING**
You must use the procedures described in this manual to install your accessory, and you must obey all safety instructions and take note of all appropriate precautions. If you do not, you can damage the accessory or other equipment and can cause injury to people.

**WARNING**
The user of the EXT pump system is responsible for safe operation and monitoring of the system.

**WARNING**
Before you install the accessory, ensure that you switch off the pump and isolate the controller/podule as described below.

Before you install your accessory, you must:
- Switch off the EXT pump and wait until the pump has stopped rotating.
- Isolate the pump controller* from the electrical supply.

If you have an EXT DX pump: isolate the podule from the electrical supply.

* An EXC Controller or a TIC (Turbo Instrument Controller)

2 BX bakeout band

2.1 Description

You can fit an Edwards BX bakeout band to an EXT pump to increase the rate of degassing of the pump body, to achieve faster pump down and lower ultimate pressure. You should only fit BX bakeout bands to CF flanged pumps intended for use at ultra high vacuum.

BX bakeout bands are available for use with electrical supplies of 110 or 240 V a.c. and can be powered from a rear panel socket on the EXC Controller, from a rear panel socket on a TIC Relay Box, or from any suitable electrical supply.

2.3 Installation

2.3.1 Unpack and inspect

Remove all packing materials and protective covers and check the BX bakeout band.

If the BX bakeout band is damaged, notify your supplier and the carrier in writing within three days; state the Item Number of the BX bakeout band together with your order number and your supplier's invoice number. Retain all packing materials for inspection. Do not use the BX bakeout band if it is damaged.

2.3.2 Fit the BX bakeout band to the pump

1. Switch off the pump, isolate the pump controller from the electrical supply (on an EXT DX pump, isolate the podule from the electrical supply), and wait until the pump has stopped rotating.

2. Fit the BX bakeout band over the pump-body below the inlet-flange at the position shown by Figure 1, item 16 or Figure 2, item 12.

3. Tighten the clamping-screw.

2.3.3 Electrical connection to an EXC controller

The BX bakeout band is supplied with a 3 metre cable terminated with an IEC connector. The connector fits the rear panel socket on the EXC120, EXC300 and EXC300M Controllers.

If you have an EXDC or EXC100 Controller, or you have an EXT DX pump, you must use either a TIC Relay Box as described in Section 2.3.4, or an independent electrical supply as described in Section 2.3.5.

1. Check that the rating of the fuse fitted in the rear-panel of the EXC Controller corresponds to the fuse rating stamped on the BX bakeout band. (Two spare fuses are supplied with the BX bakeout band).

2. Insert the connector into the socket in the rear of the EXC Controller.

3. Refer to the EXC Controller instruction manual to complete the installation.

2.3.4 Electrical connection to a TIC relay box

Refer to the TIC Relay Box instruction manual for information on how to fit the correct fuse, and how to connect the bakeout band to the TIC Relay Box.

2.3.5 Electrical connection to an independent electrical supply

If necessary, you can connect the BX bakeout band directly to an appropriate electrical supply.

Always ensure that the electrical supply to the BX bakeout band is interlocked so that it is automatically switched off whenever the EXT pump operates below normal speed. Check that the rating of the fuse fitted within your electrical supply corresponds to the fuse rating stamped on the BX bakeout band.
2.4 Operation

**WARNING**

Do not operate the BX bakeout band when it is not installed on a pump. Without the cooling effect of the pump-body, the temperature of the band can rise to 300 °C with the danger of insulation breakdown and fire.

**WARNING**

Do not touch the BX bakeout band when it is switched on, as it can get very hot during operation.

**CAUTION**

Do not allow the temperature of the EXT pump envelope to rise above 100 °C, whether you use the BX bakeout band on its own or with bakeout heaters on your vacuum system.

When you use the bakeout band, ensure that there is adequate cooling for the pump and adequate ventilation for the bakeout band.

If you use an EXC120, EXC300 or EXC300M Controller to power the BX bakeout band, the operation of the BX bakeout band is controlled from the 'Heater' switch on the front panel of the EXC Controller. The 'Heater' switch is interlocked with the 'Start/Reset' switch and the pump 'Normal' indication; the bakeout band is switched off automatically if the EXT pump is overloaded.

Refer to the EXC Controller instruction manual for additional information.

If you have connected the bakeout band to a TIC Relay Box, refer to the TIC instruction manual for instructions on how to use the TIC to control the operation of the bakeout band.
This page has been intentionally left blank.
3 ACX air-cooler

3.1 Description

An ACX air-cooler is used when a suitable cooling-water supply is not available for the pump or for a mobile pumping system. The ACX air-cooler is an enclosed electric fan and fixing bracket assembly which is easily fitted to bolt holes in the base of the pump. The ACX air-cooler has a 24 V d.c. motor which can be powered from a rear panel socket on the EXC Controller, an EXT DX module, a TIC, or any suitable electrical supply.

All air-coolers are supplied with side-mounting brackets. The ACX250 is also supplied with an axial-mounting bracket for optional use with EXT250M pumps only.

The ACX400 air-coolers are available for both axial and radial mounting. It is possible to use both variants simultaneously if so desired and space allows. TICs can provide power for one fan only.

Refer to the EXT pump instruction manual to check the suitability of air cooling in your particular application.

5. Spacers (4 off)
6. EXT555H pump-base
3.3 Installation

3.3.1 Unpack and inspect

Remove all packing materials and protective covers and check the ACX air-cooler.

If the ACX air-cooler is damaged, notify your supplier and the carrier in writing within three days; state the Item Number of the ACX air-cooler together with your order number and your supplier’s invoice number. Retain all packing materials for inspection. Do not use the ACX air-cooler if it is damaged.

3.3.2 Side (or radial) mounting

WARNING
Before you install the accessory, ensure that you switch off the pump and isolate the controller/podule as described below.

1. Switch off the pump, isolate the pump controller from the electrical supply (on an EXT DX pump, isolate the podule from the electrical supply), and wait until the pump has stopped rotating.

2. Continue at Step 3 in the appropriate EXT75DX pumps, EXTPX pumps, EXT555H pumps or Other pumps procedure below, depending on the type of your pump.

3.3.2.1 EXT75DX pumps

3. Unscrew the rubber pump mounting feet.

4. Fit the ACX75 air-cooler mounting bracket to the base of the pump, and refit the mounting feet to secure the mounting bracket in place.

3.3.2.2 EXTPX pumps

Refer to Figure 12 and 13.

3. Unscrew the rubber pump mounting feet.

4. The ACX400 radial cooling kits can be attached to the EXTPX pumps via fixing holes on the base of the product using 5 x M8 screws (supplied). To ensure that the radial cooling kit works most effectively it is recommended that the fan should be placed directly opposite the booster port position. This ensures adequate cooling of the EXDC controller.

3.3.2.3 EXT555H pumps

To base-mount the air-cooler:

3. Refer to Figure 20. Unscrew the rubber pump mounting feet (4).

4. Fit the mounting bracket of the ACX555 air-cooler (2) to the pump-base (6) in the most suitable orientation.

5. Use two M8 x 25 fixing screws (3) and two of the pump mounting feet (4) to secure the mounting bracket in place.

6. Use two spacers (5) and refit the other two pump mounting feet.

To flange-mount the air-cooler, do not refit the pump mounting feet, but use four screws to secure the air-cooler to the pump.
3.3.2.4 Other pumps

3. If necessary, use the two screws supplied to fix the side-mounting bracket onto the air-cooler: refer to the appropriate Figure 6, 8, 11, 18 or 20.

4. Fix the assembled air-cooler and mounting bracket onto the pump-base; use the screws and washers (if applicable) supplied.

3.3.3 Axial mounting

**WARNING**

Before you install the accessory, ensure that you switch off the pump and isolate the controller as described below.

*Note:* Axial mounting is only available on EXT250M or EXTPX pumps.

1. Switch off the pump, isolate the pump controller from the electrical supply, and wait until the pump has stopped rotating.

2. Continue at Step 3 in EXT250M pump, EXTPX (axial) or EXTPX (combined radial and axial) section as appropriate.

3.3.3.1 EXT 250M pumps

3. Refer to Figure 9. Use two M5 x 5 screws to fix the right-angle bracket onto the pump-base. Choose the two holes in the pump-base which are most convenient for your installation.

4. Use the two M5 x 5 screws supplied to fit the fan onto the bracket on the pump-base.

3.3.3.2 EXTPX pumps

Refer to Figure 14 and 15.

3. Unscrew the rubber pump mounting feet.

4. Pass the 4 x M4 screws (supplied) through the fan blades to attach the fan to the pump. To access all the fixing holes the fan blades may need to be rotated carefully by hand.

5. With the fan securely fixed to the pump body the protective guard supplied with the product must be attached next. This will ensure safe operation of the cooling assembly. With the protective guard attached the fan can then be connected to the power supply.

3.3.4 Combined radial and axial mounting

Refer to Figure 16.

Maximum pump cooling can be obtained with the simultaneous use of radial and axial cooling fans. The fan arrangements can be coupled together as shown in Figure 16.

3. Unscrew the rubber pump mounting feet.

4. To attach both air-cooling accessories to the pump, firstly combine the two fan arrangements using the 3 x M4 x 10 joining fixings (supplied with the axial fan arrangement).

5. The combined assembly can then be attached to the product via the 4 x M5 axial fan mounting holes. To access all the fixing holes the fans blades on the axial air cooler may need to be rotated carefully by hand.

6. With the fan securely fixed to the pump body the axial cooler protective screen must be attached next. This will ensure safe operation of the cooling assembly. With the protective screen attached the fans can then be connected to the power supply.
3.3.5 Electrical connection

**CAUTION**
Ensure that the electrical supply is correct. If it is not, you can damage the ACX air-cooler.

**CAUTION**
Ensure that the power supply to the cooling accessory can be isolated in a fault condition if required.

The ACX air-cooler requires a 24 V d.c. electrical supply. You can connect the ACX air-cooler to an EXC Controller, a TIC or an EXT DX podule, or you can use your own electrical supply.

**Note:** For combined use of both axial and radial ACX400 air-coolers, a TIC can be used to supply power to one ACX. A separate 24 V power supply is required.

Use the following procedure to make the electrical connections.

1. Shorten the cable to the required length and reconnect the ring terminal.
2. Connect the cable cores to an EXC Controller (refer to the EXC Controller instruction manual), to a TIC (refer to the TIC instruction manual), to a podule connector plug (refer to Figure 21), or to your own electrical supply.
3. Connect the cable screen to a suitable earth (ground) connection. For EXTPX, an uninsulated braid may be used. Use the M5 x 10 screw and shake-proof washer supplied (attached to fan cowling) to secure the earth conductor to the air-cooler.
4. Switch on the ACX air-cooler (refer to the EXT DX, EXC or TIC instruction manual, or switch on your own electrical supply) and ensure that the fan in the ACX air-cooler rotates in the correct direction (that is, that cooling-air is blown towards the EXT pump). If the direction of rotation is incorrect, check and correct the electrical connections.

3.4 Operation

**WARNING**
There is no guard on the outlet of the fan in the ACX air-cooler. Therefore, you must not operate the air-cooler unless it is installed on the pump.

**WARNING**
The protective guard for the inlet of the ACX400 axial air-cooler or ACX400 axial-radial combination must be attached before connection to the electrical supply.

Operation of the ACX air-cooler depends on how you have connected it:

- If you have connected the ACX air-cooler to an EXC Controller, use the EXC Controller to operate the ACX air-cooler: refer to the EXC Controller instruction manual.
- If you have connected the ACX air-cooler to the podule of an EXT DX pump, reconfigure the podule to operate the fan: refer to the EXT DX pump instruction manual.
- If you have connected the ACX air-cooler to a TIC: refer to the TIC instruction manual for operating instructions.
- If you have connected the ACX air-cooler to your own electrical supply, switch on the electrical supply to operate the ACX air-cooler.
When you operate the ACX air-cooler, do not obstruct the fan-inlet; ensure that there is an adequate supply of cooling-air. During operation, if the temperature of any surface of the pump is higher than 60 °C the pump is too hot and you must increase the cooling.

Figure 21 - EXT DX podule connector plug

1. -ve (negative) connection
2. +ve (positive) connection
4 TAV vent-valve

4.1 Description

To maintain cleanliness of your vacuum system, we recommend that you vent the pump or vacuum system whenever you switch the pump off.

The TAV vent-valves are 24 V d.c., electrical-solenoid operated valves which you can use to vent your vacuum system with atmospheric air or dry nitrogen when you switch the EXT pump off.

The TAV vent-valve is normally open when the solenoid is de-energised; this is the configuration that you need to use an EXC Controller, a TIC or an EXT DX module to control the vent-valve.

Refer to Figure 23. The TAV vent-valve is supplied with a sintered bronze inlet-filter (1), a rifled hose connector (7) and 3 metres of cable.

You can connect your dry nitrogen supply to the hose connector.

An NW10 adaptor (3) is also supplied to convert the 1/8 inch BSP outlet connector (Figure 22, item 2) of the TAV vent-valve for direct connection to your vacuum system.

The TAV vent-valve can be powered and controlled from an EXC Controller, a TIC, an EXT DX module, or from any suitable electrical supply.

### Installation

#### 4.3.1 Unpack and inspect

Remove all packing materials and protective covers and check the TAV vent-valve.

If the TAV vent-valve is damaged, notify your supplier and the carrier in writing within three days; state the Item Number of the TAV vent-valve together with your order number and your supplier’s invoice number. Retain all packing materials for inspection. Do not use the TAV vent-valve if it is damaged.
4.3.2 Fit the TAV vent-valve to the pump

**WARNING**
Before you install the accessory, ensure that you switch off the pump and isolate the controller/podule as described below.

1. Switch off the pump, isolate the pump controller from the electrical supply (on an EXT DX pump, isolate the podule from the electrical supply), and wait until the pump has stopped rotating.
2. If your EXT pump has a manual vent-valve, unscrew and remove it, then continue at Step 4.
3. Refer to Figure 23. If your EXT pump does not have a manual vent-valve, fit the vent-valve adaptor (3) to a suitable NW10 flange on your pump or vacuum system.
4. Check that the TAV vent-valve O-ring (4) is fitted and screw the TAV vent-valve into the vent-valve adaptor or into the 1/8 inch BSP hole vacated by the manual vent-valve.
5. Connect your dry nitrogen or other inert gas supply pipeline to the M5 inlet (2) or use the rifled hose connector (7) supplied.
6. If you vent the pump with air, fit the sintered bronze inlet-filter (1) to protect your system against the entry of dust.

4.3.3 Electrical connection

**CAUTION**
Ensure that the electrical supply is correct. If it is not, you can damage the TAV vent-valve.

The TAV vent-valve requires a 24 V d.c. electrical supply. You can connect the TAV vent-valve to an EXC Controller, a TIC, an EXT DX podule, or your own electrical supply. Use the following procedure to make the electrical connections.

1. Shorten the cable to the required length.
2. Connect the cable cores to an EXC Controller (refer to the EXC Controller instruction manual), to a TIC (refer to the TIC instruction manual), to an EXT DX podule connector plug (refer to Figure 21), or to your own electrical supply.
3. Connect the cable screen to a suitable earth (ground) connection.

4.4 Operation

**CAUTION**
If you manually vent the pump when it is at full rotational speed and the rate of pressure rise is too high, the pump life may be reduced. When using the manual vent valve supplied, we recommend that you either limit the vent or only open the vent-valve after the EXT406PX pump speed has fallen to 50% of full rotational speed. Do not vent from the backing line as this may lead to contamination. If you vent into your vacuum system and use an oil sealed rotary backing pump, select a point upstream of the EXT PX pump, to prevent oil back-streaming from the backing line.

Operation of the TAV vent-valve depends on how you have connected it:

- If you have connected the TAV vent-valve to an EXC Controller, use the EXC Controller to operate the vent-valve: refer to the EXC Controller instruction manual.
- If you have connected the TAV vent-valve to the podule of an EXT DX pump: refer to the EXT DX pump instruction manual.
- If you have connected the TAV vent-valve to a TIC: refer to the TIC instruction manual for operating instructions.
- If you have connected the TAV vent-valve to your own electrical supply, switch on the electrical supply to operate the vent-valve.

5 Vibration isolator

5.1 Description

A Vibration Isolator can be fitted to the inlet-flange of your EXT pump to reduce the transmission of the small amount of vibration generated by the pump to your vacuum system.

The Vibration Isolator has two flanges separated by a flexible stainless steel bellows and an outer rubber anti-vibration collar.

The Vibration Isolator is designed for use with a vertically mounted pump only.

5.2 Technical data

</table>

* Vibration attenuation depends on frequency of interest and mass of vacuum system. Stated value is typical for vibration at pump operational frequency, and for system with mass of ~200 kg.
5.3 Installation

5.3.1 Unpack and inspect

Remove all packing materials and protective covers and check the Vibration Isolator.

If the Vibration Isolator is damaged, notify your supplier and the carrier in writing within three days; state the Item Number of the Vibration Isolator together with your order number and your supplier's invoice number. Retain all packing materials for inspection. Do not use the Vibration Isolator if it is damaged.

5.3.2 Fit the vibration isolator

**WARNING**

Before you install the accessory, ensure that you switch off the pump and isolate the controller/podule as described below.

Fit the Vibration Isolator as described below. Refer to the instruction manual supplied with your EXT pump to determine the minimum number of bolts or clamps that you will need to fit the Vibration Isolator to the pump inlet-flange. You must use the same number of bolts or clamps to fit the upper flange of the Vibration Isolator to your vacuum system.

1. Switch off the pump, isolate the pump controller from the electrical supply (on an EXT DX pump, isolate the podule from the electrical supply), and wait until the pump has stopped rotating.
2. Fit the Vibration Isolator between the inlet-flange of your EXT pump and your vacuum system.
3. Fit a flexible bellows between the EXT pump backing-port and the backing-pump to prevent the transmission of vibration or strain between the two pumps.
4. Fit a suitable restraint so that the pump cannot rotate on its axis in the unlikely event of total seizure of the pump rotor. The figure below shows a suitable arrangement, using bolts and a support frame with clearance holes.

**WARNING**

The vibration isolator is unable to withstand the large forces generated in the event of total rotor failure. An additional restraining means must be fitted.

6 Inlet screens

6.1 Description

Inlet-screens are factory-fitted to all new EXT pumps. If you have an EXT pump without an inlet-screen, we recommend that you fit an inlet-screen for additional safety. The only exception to this is the main ports in the END faces of split flow pumps. Plastic covers must be retained on these variants until ready to install to minimise the risk of injury from impeller blades.

The inlet-screen prevents the entry of debris into the pump and also prevents people from coming into contact with the blades if the pump is switched on when it is disconnected from your vacuum system.

6.2 Technical data

Note: Refer to the pump instruction manual for details of performance reductions when an inlet-screen is fitted.

6.3 Installation

6.3.1 Unpack and inspect

Remove all packing materials and protective covers and check the inlet-screen.

If the inlet-screen is damaged, notify your supplier and the carrier in writing within three days; state the Item Number of the inlet-screen together with your order number and your supplier's invoice number. Retain all packing materials for inspection. Do not use the inlet-screen if it is damaged.
6.3.2 Fit or remove the inlet-screen

**WARNING**

Before you install the accessory, ensure that you switch off the pump and isolate the controller/podule as described below.

**WARNING**

If you remove the inlet-screen, there will be a risk of injury from exposed sharp edges in the pump.

**CAUTION**

Do not remove the inlet-screen unless you can be sure that debris cannot fall into the pump. Debris which falls into the pump can seriously damage it.

**Note:** If you have an EXT pump with an NW40 or NW50 inlet-flange, inlet-screen replacement must be carried out by Edwards; you cannot replace the inlet-screen yourself.

1. Switch off the pump, isolate the pump controller from the electrical supply (on an EXT DX pump, isolate the podule from the electrical supply), and wait until the pump has stopped rotating.

2. Use the following appropriate procedure according to the type of inlet-screen.

### 6.3.2.1 ISX inlet-screens

To remove the ISX inlet-screen:

- Use a wire hook or a small screwdriver to carefully extract the inlet-screen from the pump inlet-flange.

To fit the ISX inlet-screen:

- Refer to Figure 25. Lower the inlet-screen (with the Edwards logo (if present) at the top) into the pump-inlet until the dimples on the rim of the screen engage in the groove in the pump-inlet bore, as shown in Figure 25. If necessary, bend the rim of the screen outwards to ensure a good fit.

### 6.3.2.2 ISDX inlet-screens

To remove the ISDX inlet-screen:

- Use a wire hook or a small screwdriver to carefully lever the inlet-screen from the pump inlet-flange.

To fit the ISDX inlet-screen:

- Refer to Figure 26. Hold the inlet-screen (with the tags pointing upwards) centrally over the pump inlet-flange.
- With your fingers spread evenly around the edge of the inlet-screen, push the inlet-screen firmly into the bore of the inlet-flange.
- Ensure that all of the tags on the rim of the inlet-screen are correctly positioned under the rim of the inlet-flange. If necessary, use a suitable tool to press the tags into position.
6.3.2.3 ISHX inlet-screens

**CAUTION**

Do not remove the three screws (Figure 27, item 1). If you do, the pump settings may change, and the pump may not operate correctly, or have a shortened operating life.

To remove the ISHX inlet-screen:

- Refer to Figure 27. Undo and remove the three screws (3) which secure the inlet-screen (2), then remove the inlet-screen. Do not remove or loosen the other three screws (1).

To fit the ISHX inlet-screen:

- Refer to Figure 27. Fit the inlet-screen (2) in position and secure with the three securing screws (3). Do not remove or loosen the other three screws (1).

7 PRX10 purge-restrictor

7.1 Description

The PRX10 purge-restrictor (shown in Figure 28) sets the purge gas flow rate.

The following EXT pumps have a purge-port facility to allow you to purge the motor and bearing cavity with dry nitrogen or other inert gas:

- EXT75DX, EXT75iDX.
- EXT250, EXT250H, EXT250Hi, EXT250M, EXT255DX, EXT255iDX, EXT255H and EXT255Hi.
- EXT 351 and EXT501 (all models).
- EXT555H, EXT555HF, EXT555Hi, EXT555HE and EXT556.
- EXT406PX and EXTPX split flow

Note that you will need a vent-port adaptor (see Section 9) to fit the PRX10 purge-restrictor.

7.2 Technical data

<table>

</tr>
</thead>
<tbody>
<tr>
<td>Nominal nitrogen flow rate*</td>
</tr>
<tr>
<td>Flange size</td>
</tr>
<tr>
<td>Item Number</td>
</tr>
</tbody>
</table>

* At a supply pressure of 0 bar gauge (1 x 10⁹ Pa)

7.3 Installation

7.3.1 Unpack and inspect

Remove all packing materials and protective covers and check the PRX10 purge-restrictor.

If the PRX10 purge-restrictor is damaged, notify your supplier and the carrier in writing within three days; state the Item Number of the PRX10 purge-restrictor together with your order number and your supplier’s invoice number. Retain all packing materials for inspection. Do not use the PRX10 purge-restrictor if it is damaged.
7.3.2  Fit the purge-restrictor

**WARNING**
Before you install the accessory, ensure that you switch off the pump and isolate the controller/podule as described below.

**CAUTION**
Do not exert any sideways force on the purge-restrictor when you clamp it into place. If you do, you can damage the seal between the O-ring (Figure 28, item 2) and the body of the purge-restrictor. If the seal is damaged, gas may leak through the seal and you will not be able to properly control gas flow into the pump.

**Note:** If you will use a purge gas other than nitrogen, you must calibrate the purge-restrictor (refer to Section 7.4.2) before you connect your purge gas supply.

1. Switch off the pump, isolate the pump controller from the electrical supply (on an EXT DX pump, isolate the podule from the electrical supply), and wait until the pump has stopped rotating.
2. Remove the blank and clamp from the purge-port on the pump.
3. Attach your purge gas supply pipeline (which must be terminated with an NW10 flange) to the purge-port with the PRX10 purge-restrictor in place of the normal NW10 centring-ring.
4. Carefully secure the connection with the NW10 clamp.

7.4  Operation

7.4.1  General

The PRX10 purge-restrictor, as supplied, is adjusted to restrict the flow rate of dry nitrogen, at a supply pressure of 0 bar gauge (1 x 10⁵ Pa), to 25 sccm (0.42 mbar l s⁻¹, 42 Pa l s⁻¹). You can increase the supply pressure to increase the flow rate; see Table 7.

For most applications, you can use a nitrogen flow rate of 25 sccm (0.42 mbar l s⁻¹, 42 Pa l s⁻¹) to 30 sccm (0.5 mbar l s⁻¹, 50 Pa l s⁻¹). To do this, your nitrogen supply pressure must be 0.1 to 0.2 bar gauge (1.1 x 10⁵ to 1.2 x 10⁵ Pa). Do not exceed the maximum purge gas supply pressure given in the instruction manual supplied with your pump.

7.4.2  Calibration of the PRX10 for different purge gases

The purge gas flow rate at a particular supply pressure will change if you use a different purge gas.

If you want to use a different purge gas, use the procedure below to adjust the flow rate.

1. Fit the PRX10 purge-restrictor to the pump as described in Section 7.3.2. Fit a calibrated mass flowmeter between your purge gas supply and the PRX10 purge-restrictor.
2. Switch on the backing-pump to evacuate the EXT pump, then turn on your purge gas supply.
3. Monitor the indicated purge gas flow rate while you adjust the purge gas supply pressure. If you can achieve the required flow rate, you do not need to adjust the purge-restrictor; in this case, continue at Step 5 below.
4. Refer to Figure 28. If you cannot achieve the required flow rate, undo the locknut (3) on the purge-restrictor and use a small screwdriver to turn the adjustment screw (4) clockwise to decrease the flow rate or anticlockwise to increase the flow rate. Tighten the locknut.
5. Turn off your purge gas supply, remove the mass flow meter and connect your purge gas supply to the purge-restrictor.

8 Pump-to-controller cable

Note: Pump-to-controller cables are not applicable to EXT DX pumps. If you need extension cables for EXT DX pumps, refer to the Edwards catalogue, or contact your supplier or Edwards.

8.1 Description

Complete cables are available for 80 V pumps in 1, 3 and 5 metre lengths to suit your application.

The EXT250M pump is supplied with an EXC300M Controller and a 1, 3 or 5 metre cable.

8.3 Installation

8.3.1 Unpack and inspect

Remove all packing materials and protective covers and check the cable.

If the cable is damaged, notify your supplier and the carrier in writing within three days; state the Item Number of the cable together with your order number and your supplier’s invoice number. Retain all packing materials for inspection. Do not use the cable if it is damaged.

8.3.2 Connect the pump-to-controller cable

WARNING

Before you install the accessory, ensure that you switch off the pump and isolate the controller as described below.

1. If the pump is operating: switch off the pump, isolate the pump controller from the electrical supply, and wait until the pump has stopped rotating.

2. If fitted, remove the existing pump-to-controller cable.

3. Fit the new pump-to-controller cable: refer to the controller instruction manual.
9 Vent-port adaptor

9.1 Description

The 1/8 inch BSP(P) male to NW10 vent-port adaptor can be used to convert the 1/8 inch BSP(P) female vent port on all EXT pumps to an NW10 flange. An alternative vent valve to the TAV 5/6 or a vent pipeline may then be fitted to this flange. See Figure 29.

Figure 29 - Vent-port adaptor

The vent-port adaptor is supplied with a removable flow restrictor and an O-ring to seal the adaptor to the pump. It is best suited to the following pump types:

- EXT75DX, EXT75iDX
- EXT255DX, EXT255iDX
- EXT255H, EXT255Hi
- EXT556H, EXT555H and EXT555HE
- EXT406PX and EXTPX split flow

Also available is an extended vent-port adaptor which is intended for use with the split-flow turbo pumps where the backing port is too close to the vent-port to allow the standard vent-port adaptor to be used. The extended vent-port adaptor is supplied with an O-ring to seal to the pump, NW10 centering ring and NW10/16 clamping ring. Refer to Figure 30.
CAUTION

The extended vent-port adaptor is not supplied with a removable flow restrictor. Venting a turbo pump from atmosphere, through the extended vent-port adaptor, would cause damage to the turbo pump. To vent a turbo pump when using the extended vent-port adaptor, you must either control the flow-rate to the adaptor or incorporate a 0.8 mm orifice in the pipeline used to connect to the extended vent-port adaptor.

The extended vent-port adaptor is best suited to the following pump types:

- EXT200/200H
- EXT200/200Hi
- EXT200/200/30H
- EXT400/200/30H
- EXT70/70/200H

9.3 Installation

9.3.1 Unpack and inspect

Remove all packing materials and protective covers and check the vent-port adaptor.

If the vent-port adaptor is damaged, notify your supplier and the carrier in writing within three days; state the Item Number of the vent-port adaptor together with your order number and your supplier’s invoice number. Retain all packing materials for inspection. Do not use the vent-port adaptor if it is damaged.

9.3.2 Connect the vent-port adaptor

WARNING

Before you install the accessory, ensure that you switch off the pump and isolate the controller/podule as described below.

1. Switch off the pump, isolate the pump controller from the electrical supply (on an EXT DX pump, isolate the podule from the electrical supply), and wait until the pump has stopped rotating.

2. Unscrew and remove the manual vent-valve or the plug in the purge port from the EXT pump.

3. Refer to Figure 30. Check that the vent-port adaptor has an O-ring (2) fitted and screw the adaptor into the 1/8 inch BSP vent-port. Tighten the adaptor so that it seals firmly against the face of the vent-port.

4. Connect your vent pipeline to the NW10 flange (1) of the adaptor with suitable fittings.
This page has been intentionally left blank.
10 VRX vent - restrictor

10.1 Description

Notes:
1. A VRX vent-restrictor can be fitted in any EXT pump vent-port or purge-port.
2. EXT250M pumps are supplied with a purge port (sealed with a purge plug), and with VRX10 vent-restrictors fitted in the vent and purge ports.

Fit a VRX vent-restrictor to your EXT pump if you will vent the pump when the pump speed is above 50% of full rotational speed. The vent-restrictor restricts the flow-rate of the vent gas into the EXT pump.

You can fit the VRX vent-restrictor directly to the inlet of a vent-port adaptor, together with a TAV vent-valve (if required). Note that you must fit the vent-restrictor before you fit the TAV vent-valve or vent-port adaptor.

10.2 Technical data

</tbody>
</table>

10.3 Installation

10.3.1 Unpack and inspect

Remove all packing materials and protective covers and check the vent-restrictor. The VRX identification number (Figure 31, item 5) is located on the restrictor base; for example, if you have a VRX20 vent-restrictor, ‘20’ will be shown on the base of the restrictor.

If the vent-restrictor is damaged, notify your supplier and the carrier in writing within three days; state the Item Number of the vent-restrictor together with your order number and your supplier’s invoice number. Retain all packing materials for inspection. Do not use the vent-restrictor if it is damaged.

10.3.2 VRX vent-restrictor selection

Make sure that you have the correct vent-restrictor for your pump and vacuum system. Refer to your EXT pump instruction manual for selection details.

You must not exceed the maximum allowable rate of pressure rise specified in the EXT pump instruction manual.
10.3.3 Fit the vent-restrictor

**WARNING**

Before you install the accessory, ensure that you switch off the pump and isolate the controller/podule as described below.

Use the following procedure to fit the vent-restrictor to an EXT pump:

1. Switch off the pump, isolate the pump controller from the electrical supply (on an EXT DX pump, isolate the podule from the electrical supply), and wait until the pump has stopped rotating.

2. Remove the vent-valve or plug from the EXT pump, or disconnect the vacuum connections from the purge port as appropriate.

3. Refer to Figure 31. If a vent-restrictor is already fitted, fit a suitable M3 screw into the M3 tapped hole (2) in the restrictor, then pull the screw to remove the old vent-restrictor.

4. Fit a suitable M3 screw to the new restrictor and push the new restrictor fully into the vent-port or purge-port of the EXT pump.

5. Remove the M3 screw and refit the vent-valve or plug, or reconnect the vacuum connections to the purge-port.

*Figure 31 - VRX vent-restrictor*
11 WCX water-cooler

11.1 Description

Note: A WCX water-cooler is fitted to some EXT pumps as standard: refer to your pump instruction manual.

A WCX water-cooler can be fitted to all EXT pumps, to provide water-cooling during pump operation.

Refer to the pump instruction manual to determine the operating conditions under which you must use water-cooling.

11.3 Installation

11.3.1 Unpack and inspect

Remove all packing materials and protective covers and check the WCX water-cooler.

If the water-cooler is damaged, notify your supplier and the carrier in writing within three days; state the Item Number of the water-cooler together with your order number and your supplier’s invoice number. Retain all packing materials for inspection. Do not use the water-cooler if it is damaged.

1. Pump base
2. WCX555 water-cooler
3. Screws: M8 x 25 (4 off)
4. Pump mounting feet (4 off, supplied with the pump)
11.3.2 Fit the water-cooler to the pump

**WARNING**
Before you install the accessory, ensure that you switch off the pump and isolate the controller/podule as described below.

1. Switch off the pump, isolate the pump controller from the electrical supply (on an EXT DX pump, isolate the podule from the electrical supply), and wait until the pump has stopped rotating.

2. Continue at the appropriate procedure below, according to your model of water-cooler.

11.3.2.1 WCX250 and WCX500 water-coolers

1. If necessary, remove the old water-cooler from the pump, and retain the fixing screws.

2. Use the screws removed in Step 1, or the two or three screws supplied (depending on the pump model) to secure the new water-cooler to the pump.

3. Remove the protective covers from the ends of the riffled nozzles.

4. Fit and secure your cooling-water hoses to the riffled nozzles. Ensure that you route the hoses away from any electrical cables, wires and connections.

5. Briefly turn on the cooling-water supply and check for water leaks. Seal any leaks found.

11.3.2.2 WCX555 water-cooler

**CAUTION**
When you fit the WCX555 accessory, do not apply any thermal compound to either the water-cooler or the EXT pump.

1. Fit the protective cover supplied with the pump to the pump-inlet, then turn the pump upside down.

2. Refer to Figure 33. Unscrew and remove the four pump mounting feet (4).

3. Use the four M8 x 25 cap-head screws (3, supplied with the water-cooler) to secure the cooling plate to the base of the pump.

4. Refit the four pump mounting feet (4).

5. Remove the protective covers from the ends of the riffled nozzles.

6. Fit and secure your cooling-water hoses to the riffled nozzles. Ensure that you route the hoses away from any electrical cables, wires and connections.

7. Briefly turn on the cooling-water supply and check for water leaks. Seal any leaks found.

11.4 Operation

**CAUTION**

Ensure that the cooling-water flow is correct for the pump operating conditions. Insufficient or excess cooling-water flow can damage the pump.

Refer to your EXT pump instruction manual for:
- The operating conditions under which you must use water-cooling.
- The necessary cooling-water supply flow rates and temperatures.
12 Maintenance

Edwards EXT Accessories require little user maintenance and contain no user serviceable parts. To maintain the accessories in normal use, do the appropriate checks below when you maintain the pump.

- Check that all mechanical fixings are secure.
- Check that any electrical connections are secure.
- Check that any electrical supply cables are undamaged.
This page has been intentionally left blank.
13 Storage and disposal

13.1 Storage

Store the accessories in cool dry conditions until required for use. When required, prepare and install the accessories as described in Section 2 to 11.

13.2 Disposal

Dispose of the accessories safely in accordance with all local and national safety and environmental requirements. Take particular care with components that have been contaminated with dangerous process substances.
